A `<gloss>` may also be supplied for an attribute name or an attribute value in similar circumstances:

```
<valList type="open">
  <valItem ident="susp">
    <gloss>suspension</gloss>
    <desc>the abbreviation provides the first letter(s)
      of the word or phrase, omitting the remainder.</desc>
  </valItem>
  <valItem ident="contr">
    <gloss>contraction</gloss>
    <desc>the abbreviation omits some letter(s) in the middle.</desc>
  </valItem>
```

```
<!--...-->
</valList>
```

Note that this is quite distinct from the use of the <desc> element, which contains a full description of the intended semantics for the object.

The contents of the <desc> element provide a brief characterization of the intended function of the object being documented in a form that permits its quotation out of context, as in the following example:

```
<elementSpec module="core" ident="foreign">
<!--... -->
  <desc>identifies a word or phrase as belonging to some language other
    than that of the surrounding text. </desc>
<!--... -->
</elementSpec>
```

By convention, a <desc> element begins with a verb such as *contains*, *indicates*, *specifies*, etc. and contains a single clause.

The <equiv> element is used to document equivalencies between the concept represented by this object and the same concept as described in other schemes or ontologies. The uri attribute is used to supply a pointer to some location where such external concepts are defined. For example, to indicate that the TEI <death> element corresponds to the concept defined by the CIDOC CRM category E69, the declaration for the former might begin as follows:

```
<elementSpec module="namesdates" ident="death">
  <equiv name="E69" uri="http://cidoc.ics.forth.gr/">
  <desc>
<!--... -->
  </desc>
</elementSpec>
```

The <equiv> element may also be used to map newly-defined elements onto existing constructs in the TEI, using the filter and name attributes to point to an implementation of the mapping. This is useful when a TEI customization (see 23.3. *Personalization and Customization*) defines ‘shortcuts’ for convenience of data entry or markup readability. For example, suppose that in some TEI customization an element <bo> has been defined which is conceptually equivalent to the standard markup construct <hi rend=‘bold’>. The following declarations would additionally indicate that instances of the <bo> element can be converted to canonical TEI by obtaining a filter from the URI specified, and running the procedure with the name bold. The mimeType attribute specifies the language (in this case XSL) in which the filter is written:

```
<elementSpec ident="bo" ns="http://www.example.com/ns/notTEI">
  <equiv
    filter="http://www.example.com/equiv-filter.xsl"
    mimeType="text/xsl"
    name="bold"/>
  <gloss>bold</gloss>
  <desc>contains a sequence of characters rendered in a bold face.</desc>
<!-- ... -->
</elementSpec>
```

The <altIdent> element is used to provide an alternative name for an object, for example using a different natural language. Thus, the following might be used to indicate that the <abbr> element should be identified using the German word *Abkürzung*:

```
<elementSpec ident="abbr" mode="change">
  <altIdent xml:lang="de">Abkürzung</altIdent>
<!--...-->
</elementSpec>
```

In the same way, the following specification for the <graphic> element indicates that the attribute url may also be referred to using the alternate identifier href:

```
<elementSpec ident="graphic" mode="change">
  <attList>
    <attDef mode="change" ident="url">
      <altIdent>href</altIdent>
    </attDef>
  <!-- .... -->
</attList>
</elementSpec>
```

By default, the <altIdent> of a component is identical to the value of its ident attribute.

The <remarks> element contains any additional commentary about how the item concerned may be used, details of implementation-related issues, suggestions for other ways of treating related information etc., as in the following example:

```
<elementSpec module="core" ident="foreign">
<!--... -->
<remarks>
  <p>This element is intended for use only where no other element
    is available to mark the phrase or words concerned. The global
    <att>xml:lang</att> attribute should be used in preference to this element
    where it is intended to mark the language of the whole of some text
    element.</p>
  <p>The <gi>distinct</gi> element may be used to identify phrases
    belonging to sublanguages or registers not generally regarded as true
    languages.</p>
</remarks>
<!--... -->
</elementSpec>
```

A specification element will usually conclude with a list of references, each tagged using the standard <ptr> element, and grouped together into a <listRef> element: in the case of the <foreign> element discussed above, the list is as follows:

```
<listRef>
  <ptr target="#COHQHF"/>
</listRef>
```

where the value COHQF is the identifier of the section in the Guidelines where this element is fully documented.

22.4.2 Exemplification of Components

<exemplum> groups an example demonstrating the use of an element along with optional paragraphs of commentary.

<eg> (example) contains any kind of illustrative example.

<egXML> (example of XML) contains a single well-formed XML fragment demonstrating the use of some XML element or attribute, in which the <egXML> element itself functions as the root element.

@valid indicates the intended validity of the example with respect to a schema.

The <exemplum> element is used to combine a single illustrative example with an optional paragraph of commentary following or preceding it. The illustrative example itself may be marked up using either the <eg> or the <egXML> element.

If an example contains XML markup, it should be marked up using the <egXML> element. In such a case, it will clearly be necessary to distinguish the markup within the example from the markup of the document itself. In an XML schema environment, this is easily done by using a different name space for the content of the <egXML> element. For example:

```
<p>The <gi>term</gi> element may be used
to mark any technical term, thus:
<egXML xmlns="http://www.tei-c.org/ns/Examples">
This <term>recursion</term> is
giving me a headache.</egXML></p>
```

When this approach is taken, but it is also desired to use markup within the example for example to indicate some aspect of its formatting, the markup concerned must be explicitly associated with the current (TEI) namespace, as in the following example:

```
<egXML xmlns="http://www.tei-c.org/ns/Examples"
xmlns:tei="http://www.tei-c.org/ns/1.0">
<div>
<head>A slide about <gi>egXML</gi></head>
<list>
<item><gi>egXML</gi> can be used to give XML examples in the TEI
Examples namespace</item>
<item>Attributes values for<att>valid</att>:
<list tei:rend="collapsed">
<item><val tei:rend="green">true</val>: intended to be fully
valid</item>
<item><val tei:rend="amber">feasible</val>: valid if missing nodes
provided</item>
<item><val tei:rend="red">false</val>: not intended to be valid</item>
</list>
</item>
<item>The<att>rend</att> attribute in the TEI namespace can be
used for recording how parts of the example was rendered.</item>
</list>
</div>
</egXML>
```

If complex rendition information is required, then the rendition attribute, in the TEI namespace, can be used.

Alternatively, the XML tagging within an example may be ‘escaped’, either by using entity references to represent the opening angle bracket, or by wrapping the whole example in a CDATA marked section:

```
<p>The <gi>term</gi> element may be used
to mark any technical term, thus:
<egXML xmlns="http://www.tei-c.org/ns/Examples">
This &lt;term&gt;recursion&lt;/term&gt; is
giving me a headache.</egXML></p>
```

or, equivalently:

```
<p>The <gi>term</gi> element may be used
to mark any technical term, thus:
<egXML xmlns="http://www.tei-c.org/ns/Examples"><![CDATA[
This <term>recursion</term> is
giving me a headache.]]></egXML></p>
```

However, escaping the markup in this way will make it impossible to validate, and should therefore generally be avoided.

If the XML contained in an example is not well-formed then it must either be enclosed in a CDATA marked section, or ‘escaped’ as above: this applies whether the `<eg>` or `<egXML>` is used. The valid attribute on `<egXML>` may be used to indicate the XML validity of the example with respect to some schema, as being valid, invalid, or feasibly valid.

An `<egXML>` element should not be used to tag non-XML examples: the general purpose `<eg>` or `<q>` elements should be used for such purposes.

22.4.3 Classification of Components

In the TEI scheme elements are assigned to one or more *classes*, which may themselves have subclasses. The following elements are used to indicate class membership:

<classes> specifies all the classes of which the documented element or class is a member or subclass.

<memberOf> specifies class membership of the documented element or class.

@key specifies the identifier for a class of which the documented element or class is a member or subclass

The `<classes>` element appears within either the `<elementSpec>` or `<classSpec>` element. It specifies the classes of which the element or class concerned is a member by means of one or more `<memberOf>` child elements. Each such element references a class by means of its key attribute. Classes themselves are defined by the `<classSpec>` element described in section 22.4.6. *Element Classes* below.

For example, to show that the element `<gi>` is a member of the class `model.phrase.xml`, the `<elementSpec>` which documents this element contains the following `<classes>` element:

```
<classes>
  <memberOf key="model.phrase.xml"/>
</classes>
```

22.4.4 Element Specifications

The `<elementSpec>` element is used to document an element type, together with its associated attributes. In addition to the elements listed above, it may contain the following subcomponents:

<content> (content model) contains the text of a declaration for the schema documented.

@autoPrefix controls whether or not pattern names generated in the corresponding RELAXNG schema source are automatically prefixed to avoid potential nameclashes.

<constraint> (constraint rules) the formal rules of a constraint

<attList> contains documentation for all the attributes associated with this element, as a series of `<attDef>` elements.

@org (organization) specifies whether all the attributes in the list are available (`org="group"`) or only one of them (`org="choice"`)

22.4.4.1 Content models

The content of the element `<content>` may be expressed in one of two ways. It may use a schema language of some kind, as defined by a pattern called `macro.schemaPattern`, which is provided by the module defined in this chapter. Alternatively, the legal content for an element may be fully specified using the `<valList>` element, described in 22.4.5. *Attribute List Specification* below.

In the case of the TEI Guidelines, element content models are defined using RELAX NG patterns, although the user may over-ride this by redefining the `macro.schemaPattern` pattern.

Here is a very simple example

```
<content>
  <rng:text/>
</content>
```

The element within whose specification element this `<content>` element appears will have a content model which is expressed in RELAX NG as text, using the RELAX NG namespace. This model will be copied unchanged to the output when RELAX NG schemas are being generated. When an XML DTD is being generated, an equivalent declaration (in this case (`#PCDATA`)) will be output.

Here is a more complex example:

```
<content>
  <rng:group>
    <rng:ref name="fileDesc"/>
    <rng:zeroOrMore>
      <rng:ref name="model.teiHeaderPart"/>
    </rng:zeroOrMore>
    <rng:optional>
      <rng:ref name="revisionDesc"/>
    </rng:optional>
  </rng:group>
</content>
```

This is the content model for the `<teiHeader>` element, expressed in the RELAX NG syntax, which again is copied unchanged to the output during schema generation. The equivalent DTD notation generated from this is (`fileDesc`, `(%model.teiHeaderPart)*`, `revisionDesc?`).

The RELAX NG language does not formally distinguish element names, attribute names, class names, or macro names: all names are patterns which are handled in the same way, as the above example shows. Within the TEI scheme, however, different naming conventions are used to distinguish amongst the objects being named. Unqualified names (`fileDesc`, `revisionDesc`) are always element names. Names prefixed with `model.` or `att.` (e.g. `model.teiHeaderPart` and `att.typed`) are always class names. In DTD language, classes are represented by parameter entities (`%model.teiHeaderPart`; in the above example); see further 1. *The TEI Infrastructure*.

The RELAX NG pattern names generated by an ODD processor by default include a special prefix, the default value for which is set using the `prefix` attribute on `<schemaSpec>`. The purpose of this is to ensure that the pattern name generated is uniquely identified as belonging to a particular schema, and thus avoid name clashes. For example, in a RELAX NG schema combining the TEI element `<ident>` with another element called `<ident>` from some other vocabulary, the former will be defined by a pattern called `TEI_ident` rather than simply `ident`. Most of the time, this behaviour is entirely transparent to the user; the one occasion when it is not will be where a content model (expressed using RELAX NG syntax) needs explicitly to reference either the TEI `<ident>` or the other one. In such a situation, the `autoPrefix` attribute on `<content>` may be used. For example, suppose that we wish to define a content model for `<term>` which permits either a TEI `<ident>` or the `<ident>` defined by some other vocabulary. A suitable content model would be generated from the following `<content>` element:

```
<content autoPrefix="false">
  <rng:choice>
    <rng:ref name="TEI_ident"/>
    <rng:ref name="ident"/>
  </rng:choice>
</content>
```

22.4.4.2 Additional constraints

In addition to the `<content>` element, a set of identified general `<constraint>` elements can be provided where rules about the validity of an element can be expressed. They are identifiable in order that a TEI customization may override, delete or change them individually. These elements follow the `<content>` element, are permitted as siblings of `<datatype>` in

<attDef>, and as children of <schemaSpec>. The constraints can be expressed in any notation which is found useful; the scheme must be recorded using the scheme attribute of <constraint>.

The TEI Guidelines themselves provide constraints using the ISO Schematron language. These are normative, and changes to them may affect conformance, just as for <content>. Although not all processors will be able to process all constraints, they should follow as many as they can.

A complete Schematron document consists of a <schema> element containing <ns> and <pattern> elements; each pattern specifies a rule and a context. In a normal TEI specification it is expected that <ns> and <pattern> elements will be placed wherever suitable for documentation, and extracted into a single Schematron schema, or embedded in another schema language. As a convenience for readers, however, TEI processors should also support the direct placement of Schematron <report> and <assert> elements inside the <constraint> element within <elementSpec>; the <pattern> and <rule> containers should then be generated automatically.

Constraints are generally used to model local rules which are outside the scope of conventional schema languages. For example, the TEI element <relation> has a note that ‘Only one of the attributes active and mutual may be supplied; the attribute passive may be supplied only if the attribute active is supplied.’, which can be written in Schematron as

```
<constraintSpec ident="activemutual" scheme="isoschematron"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron">
  <desc>Check mutually incompatible attributes</desc>
  <constraint>
    <s:report test="@active and @mutual">Only one of the attributes
      'active' and 'mutual' may be supplied</s:report>
    <s:report test="@passive and not(@active)">the attribute 'passive'
      may be supplied only if the attribute 'active' is
      supplied</s:report>
  </constraint>
</constraintSpec>
```

We may also look at rules to apply to a TEI document which is going to be rendered into accessible HTML. Since the rules refer to TEI elements, we need to declare the TEI namespace in Schematron. We can check that some sort of content is available from which the alt attribute of an HTML can be created:

```
<constraintSpec ident="alt" scheme="isoschematron"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron">
  <constraint>
    <s:ns prefix="tei" uri="http://www.tei-c.org/ns/1.0"/>
    <s:pattern id="altTags">
      <s:rule context="tei:figure">
        <s:report test="not(tei:figDesc or tei:head)"> You should
          provide information in a figure from which
          we can construct an alt attribute in HTML </s:report></s:rule></s:pattern>
      </constraint>
    </constraintSpec>
```

or we might enforce other HTML accessibility rules about tables; note here the use of a report and an assertion within one pattern:

```
<constraintSpec ident="tables" scheme="isoschematron"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron">
  <constraint>
    <s:ns prefix="tei" uri="http://www.tei-c.org/ns/1.0"/>
    <s:pattern id="Tables">
      <s:rule context="tei:table">
        <s:assert test="tei:head">A <table> should have a caption, using a <head> element</s:assert>
      </s:rule>
    </s:pattern>
  </constraint>
</constraintSpec>
```

```
<s:report test="parent::tei:body">Do not use tables to lay out the document
body</s:report></s:rule></s:pattern>
</constraint>
</constraintSpec>
```

We can also model contextual constraints in Schematron:

```
<constraintSpec ident="subclauses" scheme="isoschematron"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron">
  <constraint>
    <s:rule context="tei:div">
      <s:assert test="not(tei:div) or count(tei:div)>1">a division must contain
        at least two subdivisions</s:assert></s:rule>
    </constraint>
  </constraintSpec>
```

and base requirements on attribute values:

```
<constraintSpec ident="introtitle" scheme="isoschematron"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron">
  <constraint>
    <s:assert
      test="tei:fileDesc/tei:titleStmt/tei:title[@type='introductory']"> an introductory component of the title
      is expected
    </s:assert>
  </constraint>
</constraintSpec>
<constraintSpec ident="maintitle" scheme="isoschematron">
  <constraint>
    <s:assert
      test="tei:fileDesc/tei:titleStmt/tei:title[@type='main']"> a main title must be supplied
    </s:assert>
  </constraint>
</constraintSpec>
```

22.4.5 Attribute List Specification

The `<attList>` element is used to document information about a collection of attributes, either within an `<elementSpec>`, or within a `<classSpec>`. An attribute list can be organized either as a group of attribute definitions, all of which are understood to be available, or as a choice of attribute definitions, of which only one is understood to be available. An attribute list may also contain nested attribute lists.

The `<attDef>` element is used to document a single attribute, using an appropriate selection from the common elements already mentioned and the following which are specific to attributes:

<attDef> (attribute definition) contains the definition of a single attribute.

 @usage specifies the optionality of the attribute.

<datatype> specifies the declared value for an attribute, by referring to any datatype defined by the chosen schema language.

<defaultVal> (default value) specifies the default declared value for an attribute.

<valDesc> (value description) specifies any semantic or syntactic constraint on the value that an attribute may take, additional to the information carried by the datatype element.

<valList> (value list) contains one or more `<valItem>` elements defining possible values.

<valItem> documents a single value in a predefined list of values.

The `<attList>` within an `<elementSpec>` is used to specify only the attributes which are specific to that particular element. Instances of the element may carry other attributes which are declared by the classes of which the element is a member. These extra attributes, which are shared by other elements, or by all elements, are specified by an `<attList>` contained within a `<classSpec>` element, as described in section 22.4.6. *Element Classes* below.

22.4.5.1 Datatypes

The `<datatype>` element is used to state what kind of value an attribute may have, using whatever facilities are provided by the underlying schema language. For the TEI scheme, expressed in RELAX NG, elements from the RELAX NG namespace may be used, for example

```
<datatype>
  <rng:text/>
</datatype>
```

permits any string of Unicode characters not containing markup, and is thus the equivalent of CDATA in DTD language.

The RELAX NG language also provides support for a number of primitive datatypes which may be specified here, using the `<rng:data>` element: thus one may write

```
<datatype>
  <rng:data type="boolean"/>
</datatype>
```

to specify that an element or attribute's contents should conform to the W3C definition for `boolean`.

Although only one child element may be given, this might be a selector such as `rng:choice` to indicate multiple possibilities:

```
<datatype>
  <rng:choice>
    <rng:data type="Date"/>
    <rng:data type="Float"/>
  </rng:choice>
</datatype>
```

which would permit either a date or a real number. In fact, the child element might be a `rng:list` element to indicate that a sequence of values is required, a `rng:param` element to specify a regular expression, or even a list of explicit `rng:values`. Such usages are permitted by the scheme documented here, but are not recommended when it is desired to remain independent of a particular schema language, since the full generality of one schema language cannot readily be converted to that of another. In the TEI abstract model, datatyping should preferably be carried out either by explicit enumeration of permitted values (using the TEI-specific `<valList>` element described below), or by definition of an explicit pattern, using the TEI-specific `<macroSpec>` element discussed further in section 22.4.7. *Pattern Documentation*.

22.4.5.2 Value Specification

The `<valDesc>` element may be used to describe constraints on data content in an informal way: for example

```
<valDesc>must point to another <gi>align</gi>
element logically preceding this
one.</valDesc>
```

```
<valDesc>Values should be Library of Congress subject
headings.</valDesc>
```

```
<valDesc>A bookseller's surname,  
taken from the list in <title>Pollard and Redgrave</title>  
</valDesc>
```

As noted above, the <datatype> element constrains the possible values for an attribute. The <valDesc> element can be used to describe further constraints. For example, to specify that an attribute age can take positive integer values less than 100, the datatype data.numeric might be used in combination with a <valDesc> such as 'values must be positive integers less than 100'. Constraints expressed in this way are purely documentary; to enforce them, the <constraintSpec> element described in section 22.4.4. *Element Specifications* must be used.

More usually, however, where constraints on values are explicitly enumerated, the <valList> element is used, as in the following example:

```
<valList type="closed">  
  <valItem ident="req">  
    <gloss>required</gloss>  
  </valItem>  
  <valItem ident="mwa">  
    <gloss>mandatory when applicable</gloss>  
  </valItem>  
  <valItem ident="rec">  
    <gloss>recommended</gloss>  
  </valItem>  
  <valItem ident="rwa">  
    <gloss>recommended when applicable</gloss>  
  </valItem>  
  <valItem ident="opt">  
    <gloss>optional</gloss>  
  </valItem>  
</valList>
```

Since this value list specifies that it is of type closed, only the values enumerated and glossed above are legal, and an ODD processor will typically enforce these constraints in the schema fragment generated.

The <valList> element is also used to provide illustrative examples of the kinds of values expected. In such cases the type attribute will have the value open and the datatype will usually be data.enumerated.

The <valList> element may also be used (as a child of the <content> element) to put constraints on the permitted content of an element, as noted at 22.4.4.1. *Content models*. This use is not however supported by all schema languages, and is therefore not recommended if support for non-RELAXNG systems is a consideration.

Note that the <gloss> element is needed to explain the significance of the identifier for an item only when this is not apparent, for example because it is abbreviated, as in the above example. It should not be used to provide a full description of the intended meaning (this is the function of the <desc> element), nor to comment on equivalent values in other schemes (this is the purpose of the <equiv> element), nor to provide alternative versions of the ident attribute value in other languages (this is the purpose of the <altIdent> element).

22.4.5.3 Examples

The following <attList> demonstrates some of the possibilities; for more detailed examples, consult the tagged version of the reference material in these Guidelines.

```
<attList>  
  <attDef ident="type">  
    <desc>describes the form of the list.</desc>  
    <datatype>  
      <rng:text/>  
    </datatype>  
  </attDef>  
</attList>
```

```

<defaultVal>simple</defaultVal>
<valList type="semi">
  <valItem ident="ordered">
    <desc>list items are numbered or lettered. </desc>
  </valItem>
  <valItem ident="bulleted">
    <desc>list items are marked with a bullet or other
      typographic device. </desc>
  </valItem>
  <valItem ident="simple">
    <desc>list items are not numbered or bulleted.</desc>
  </valItem>
  <valItem ident="gloss">
    <desc>each list item glosses some term or
      concept, which is given by a label element preceding
      the list item.</desc>
  </valItem>
</valList>
<remarks>
  <p>The formal syntax of the element declarations allows
  <gi>label</gi> tags to be omitted from lists tagged <tag>list
    type="gloss"</tag>; this is however a semantic error.</p>
</remarks>
</attDef>
</attList>

```

In the following example, the `org` attribute is used to indicate that instances of the element concerned may bear either a `bar` attribute or a `baz` attribute, but not both. The `bax` attribute is always available:

```

<attList>
  <attDef ident="bax">
    <datatype>
      <rng:text/>
    </datatype>
  </attDef>
  <!-- ... -->
  <attList org="choice">
    <attDef ident="bar">
      <datatype>
        <rng:text/>
      </datatype>
    </attDef>
    <attDef ident="baz">
      <datatype>
        <rng:text/>
      </datatype>
    </attDef>
  </attList>
  <!-- ... -->
</attList>

```

22.4.6 Element Classes

The element `<classSpec>` is used to document either an *attribute class* or a ‘model class’, as defined in section 1.3. *The TEI Class System*. A corresponding `<classRef>` element may be used to select a specific named class from those available.

<classSpec> (class specification) contains reference information for a TEI element class; that is a group of elements which appear together in content models, or which share some common attribute, or both.
@type indicates whether this is a model class or an attribute class

<classRef/> points to the specification for an attribute or model class which is to be included in a schema

<attList> contains documentation for all the attributes associated with this element, as a series of **<attDef>** elements.

A model class specification does not list all of its members. Instead, its members declare that they belong to it by means of a **<classes>** element contained within the relevant **<elementSpec>**. This will contain a **<memberOf>** element for each class of which the relevant element is a member, supplying the name of the relevant class. For example, the **<elementSpec>** for the element **<hi>** contains the following:

```
<classes>
  <memberOf key="model.hiLike"/>
</classes>
```

This indicates that the **<hi>** element is a member of the class with identifier **model.hiLike**. The **<classSpec>** element that documents this class contains the following declarations:

```
<classSpec type="model" ident="model.hiLike">
  <desc>groups phrase-level elements related to highlighting that have
    no specific semantics </desc>
  <classes>
    <memberOf key="model.highlighted"/>
  </classes>
</classSpec>
```

which indicate that the class **model.hiLike** is actually a member (or subclass) of the class **model.highlighted**.

The function of a model class declaration is to provide another way of referring to a group of elements. It does not confer any other properties on the elements which constitute its membership.

The attribute type is used to distinguish between ‘model’ and ‘attribute’ classes. In the case of attribute classes, the attributes provided by membership in the class are documented by an **<attList>** element contained within the **<classSpec>**. In the case of model classes, no further information is needed to define the class beyond its description, its identifier, and optionally any classes of which it is a member.

When a model class is referenced in the content model of an element (i.e. in the **<content>** of an **<elementSpec>**), its meaning will depend on the name used to reference the class.

If the reference simply takes the form of the class name, it is interpreted to mean an alternated list of all the current members of the class. For example, suppose that the members of the class **model.hiLike** are elements **<hi>**, **<it>**, and **<bo>**. Then a content model such as

```
<content>
  <rng:zeroOrMore>
    <rng:ref name="model.hiLike"/>
  </rng:zeroOrMore>
</content>
```

would be equivalent to the explicit content model:

```
<content>
  <rng:zeroOrMore>
    <rng:choice>
      <rng:ref name="hi"/>
    </rng:choice>
  </rng:zeroOrMore>
</content>
```

```

    <rng:ref name="it"/>
    <rng:ref name="bo"/>
  </rng:choice>
</rng:zeroOrMore>
</content>

```

(or, to use RELAX NG compact syntax, `(hi|it|bo)*`). However, a content model referencing the class as `model.hiLike_sequence` would be equivalent to the following explicit content model:

```

<content>
  <rng:zeroOrMore>
    <rng:ref name="hi"/>
    <rng:ref name="it"/>
    <rng:ref name="bo"/>
  </rng:zeroOrMore>
</content>

```

(or, in RELAX NG compact syntax, `(hi,it,bo)*`).

The following suffixes, appended with an underscore, can be given to a class name when it is referenced in a content model:

alternation members of the class are alternatives

sequence members of the class are to be provided in sequence

sequenceOptional members of the class may be provided, in sequence, but are optional

sequenceOptionalRepeatable members of the class may be provided one or more times, in sequence, but are optional

sequenceRepeatable members of the class must be provided one or more times, in sequence

Thus a reference to `model.hiLike_sequenceOptional` in a content model would be equivalent to:

```

<rng:zeroOrMore>
  <rng:optional>
    <rng:ref name="hi"/>
  </rng:optional>
  <rng:optional>
    <rng:ref name="it"/>
  </rng:optional>
  <rng:optional>
    <rng:ref name="bo"/>
  </rng:optional>
</rng:zeroOrMore>

```

A reference to `model.hiLike_sequenceRepeatable` would however be equivalent to:

```

<rng:zeroOrMore>
  <rng:oneOrMore>
    <rng:ref name="hi"/>
  </rng:oneOrMore>
  <rng:oneOrMore>
    <rng:ref name="it"/>
  </rng:oneOrMore>
  <rng:oneOrMore>
    <rng:ref name="bo"/>
  </rng:oneOrMore>
</rng:zeroOrMore>

```

and a reference to `model.hiLike_sequenceOptionalRepeatable` would be equivalent to:

```
<rng:zeroOrMore>
  <rng:zeroOrMore>
    <rng:ref name="hi"/>
  </rng:zeroOrMore>
  <rng:zeroOrMore>
    <rng:ref name="it"/>
  </rng:zeroOrMore>
  <rng:zeroOrMore>
    <rng:ref name="bo"/>
  </rng:zeroOrMore>
</rng:zeroOrMore>
```

The ‘sequence’ in which members of a class appear in a content model when one of the sequence options is used is that in which the elements are declared.

In principle, all these possibilities are available to any element making reference to any class. The `<classSpec>` element defining the class may however limit the possibilities by means of its `generate` attribute, which can be used to say that this particular model may only be referenced in a content model with the suffixes it specifies. For example, if the `<classSpec>` for `model.hiLike` took the form `<classSpec id="model.hiLike" generate="sequence sequenceOptional">` then a content model referring to (say) `model.hiLike_sequenceRepeatable` would be regarded as invalid by an ODD processor.

An attribute class (a `<classSpec>` of type `atts`) contains an `<attList>` element which lists the attributes that all the members of that class inherit from it. For example, the class `att.interpLike` defines a small set of attributes common to all elements which are members of that class: those attributes are listed by the `<attList>` element contained by the `<classSpec>` for `att.interpLike`. When processing the documentation elements for elements which are members of that class, an ODD processor is required to extend the `<attList>` (or equivalent) for such elements to include any attributes defined by the `<classSpec>` elements concerned. There is a single global attribute class, `att.global`, to which some modules contribute additional attributes when they are included in a schema.

22.4.7 Pattern Documentation

The `<macroSpec>` element is used to declare and document predefined strings or patterns not otherwise documented by the elements described in this chapter. A corresponding `<macroRef>` element may be used to select a specific named pattern from those available. Patterns are used as a shorthand chiefly to describe common content models and datatypes, but may be used for any purpose. The following elements are used to represent patterns:

<macroSpec> (macro specification) documents the function and implementation of a pattern.

 @type indicates which type of entity should be generated, when an ODD processor is generating a module using XML DTD syntax.

<macroRef/> points to the specification for some pattern which is to be included in a schema

 @key the identifier used for the required pattern within the source indicated.

<remarks> contains any commentary or discussion about the usage of an element, attribute, class, or entity not otherwise documented within the containing element.

22.5 Building a Schema

The specification elements, and some of their children, are all members of the `att.identified` class, from which they inherit the following attributes:

att.identified provides the identifying attribute for elements which can be subsequently referenced by means of a key attribute.

 @ident supplies the identifier by which this element may be referenced.

 @predeclare says whether this object should be predeclared in the `tei` infrastructure module.

 @module supplies a name for the module in which this object is to be declared.

This attribute class is a subclass of the `att.combinable` class from which it (and some other elements) inherits the following attribute:

att.combinable provides attributes indicating how multiple references to the same object in a schema should be combined
 @mode specifies the effect of this declaration on its parent object.

This attribute class, in turn, is a subclass of the **att.deprecated** class, from which it inherits the following attribute:

att.deprecated provides attributes indicating how a deprecated feature will be treated in future releases.
 @validUntil provides a date before which the construct being defined will not be removed.

The validUntil attribute may be used to signal an intent to remove a construct from future versions of the schema being specified.

The <elementSpec>, <attDef> and <schemaSpec> specification elements also have an attribute which determines which namespace the object being created will belong to. In the case of <schemaSpec>, this namespace is inherited by all the elements created in the schema, unless they have their own ns.

att.namespaceable provides an attribute indicating the target namespace for an object being created

These attributes are used by an ODD processor to determine how declarations are to be combined to form a schema or DTD, as further discussed in this section.

As noted above, a TEI schema is defined by a <schemaSpec> element containing an arbitrary mixture of explicit declarations for objects (i.e. elements, classes, patterns, or macro specifications) and references to other objects containing such declarations (i.e. references to specification groups, or to modules). A major purpose of this mechanism is to simplify the process of defining user customizations, by providing a formal method for the user to combine new declarations with existing ones, or to modify particular parts of existing declarations.

In the simplest case, a user-defined schema might simply combine all the declarations from two nominated modules:

```
<schemaSpec ident="example">
  <moduleRef key="core"/>
  <moduleRef key="linking"/>
</schemaSpec>
```

An ODD processor, given such a document, should combine the declarations which belong to the named modules, and deliver the result as a schema of the requested type. It may also generate documentation for the elements declared by those modules. No source is specified for the modules, and the schema will therefore combine the declarations found in the most recent release version of the TEI Guidelines known to the ODD processor in use.

The value specified for the source attribute, when it is supplied as a URL, specifies any convenient location from which the relevant ODD files may be obtained. For the current release of the TEI Guidelines, a URL in the form <http://www.tei-c.org/Vault/P5/x.y.z/xml/tei/odd/p5subset.xml> may be used, where x.y.z represents the version number, e.g. 1.3.0. Alternatively, if the ODD files are locally installed, it may be more convenient to supply a value such as ../ODDs/p5subset.xml".

The value for the source attribute may any form of URI. A set of TEI-conformant specifications in a form directly usable by an ODD processor must be available at the location indicated. When no source value is supplied, an ODD processor may either raise an error or assume that the location of the current release of the TEI Guidelines is intended.

If the source is specified in the form of a private URI, the form recommended is `aaa:x.y.z`, where `aaa` is a prefix indicating the markup language in use, and `x.y.z` indicates the version number. For example, `tei:1.2.1` should be used to reference release 1.2.1 of the current TEI Guidelines. When such a URI is used, it will usually be necessary to translate it before such a file can be used in blind interchange.

The effect of a <moduleRef> element is to include in the schema all declarations provided by that module. This may be modified by means of the attributes `include` and `except` which allow the encoder to supply an explicit lists of elements from the stated module which are to be included or excluded respectively. For example:

```
<schemaSpec ident="example">
  <moduleRef key="core" except="add del orig reg"/>
  <moduleRef key="linking" include="linkGroup link"/>
</schemaSpec>
```

The schema specified here will include all the elements supplied by the core module except for <add>, , <orig>, and <reg>. It will also include only the <linkGroup> and <link> elements from the linking module.

Alternatively, the element `<elementRef>` may be used to indicate explicitly which elements are to be included in a schema. The same effect as the preceding example might thus be achieved by the following:

```
<schemaSpec ident="example">
  <moduleRef key="core" except="add del orig reg"/>
  <elementRef key="linkGroup"/>
  <elementRef key="link"/>
</schemaSpec>
```

Note that in this last case, there is no need to specify the name of the module from which the two element declarations are to be found; in the TEI scheme, element names are unique across all modules. The module is simply a convenient way of grouping together a number of related declarations.

A schema may also include declarations for new elements, as in the following example:

```
<schemaSpec ident="example">
  <moduleRef key="teiheader"/>
  <moduleRef key="verse"/>
  <elementSpec ident="soundClip">
    <classes>
      <memberOf key="model.pPart.data"/>
    </classes>
  </elementSpec>
</schemaSpec>
```

A declaration for the element `<soundClip>`, which is not defined in the TEI scheme, will be added to the output schema. This element will also be added to the existing TEI class `model.pPart.data`, and will thus be available in TEI conformant documents.

A schema might also include re-declarations of existing elements, as in the following example:

```
<schemaSpec ident="example">
  <moduleRef key="teiheader"/>
  <moduleRef key="teistrucre"/>
  <elementSpec ident="head" mode="change">
    <content>
      <rng:ref name="macro.xtext"/>
    </content>
  </elementSpec>
</schemaSpec>
```

The effect of this is to redefine the content model for the element `<head>` as plain text, by over-riding the `<content>` child of the selected `<elementSpec>`. The attribute specification `mode="change"` has the effect of over-riding only those children elements of the `<elementSpec>` which appear both in the original specification and in the new specification supplied above: `<content>` in this example. Note that if the value for `mode` were `replace`, the effect would be to replace all children elements of the original specification with the the children elements of the new specification, and thus (in this example) to delete all of them except `<content>`.

A schema may not contain more than two declarations for any given component. The value of the `mode` attribute is used to determine exactly how the second declaration (and its constituents) should be combined with the first. The following table summarizes how a processor should resolve duplicate declarations; the term *identifiable* refers to those elements which can have a `mode` attribute:

mode	existing	effect
value	decla-	ration

add	no	add new declaration to schema; process its children in add mode
add	yes	raise error
replace	no	raise error
replace	yes	retain existing declaration; process new children in replace mode; ignore existing children
change	no	raise error
change	yes	process identifiable children according to their modes; process unidentifiable children in replace mode; retain existing children where no replacement or change is provided
delete	no	raise error
delete	yes	ignore existing declaration and its children

22.6 Combining TEI and Non-TEI Modules

In the simplest case, all that is needed to include a non-TEI module in a schema is to reference its RELAX NG source using the `url` attribute on `<moduleRef>`. The following specification, for example, creates a schema in which declarations from the non-TEI module `svg11.rng` (defining Standard Vector Graphics) are included. To avoid any risk of name clashes, the schema specifies that all TEI patterns generated should be prefixed by the string `"TEI_"`.

```
<schemaSpec prefix="TEI_" ident="testsvg" start="TEI svg">
  <moduleRef key="header"/>
  <moduleRef key="core"/>
  <moduleRef key="tei"/>
  <moduleRef key="textstructure"/>
  <moduleRef url="svg11.rng"/>
</schemaSpec>
```

This specification generates a single schema which might be used to validate either a TEI document (with the root element `<TEI>`), or an SVG document (with a root element `<svg:svg>`), but would *not* validate a TEI document containing `<svg:svg>` or other elements from the SVG language. For that to be possible, the `<svg:svg>` element must become a member of a TEI model class (1.3. *The TEI Class System*), so that it may be referenced by other TEI elements. To achieve this, we modify the last `<moduleRef>` in the above example as follows:

```
<moduleRef url="svg11.rng">
  <content>
    <rng:define name="TEI_model.graphicLike" combine="choice">
      <rng:ref name="svg"/>
    </rng:define>
  </content>
</moduleRef>
```

This states that when the declarations from the `svg11.rng` module are combined with those from the other modules, the declaration for the model class `model.graphicLike` in the TEI module should be extended to include the element `<svg:svg>` as an alternative. This has the effect that elements in the TEI scheme which define their content model in terms of that element class (notably `<figure>`) can now include it. A RELAX NG schema generated from such a specification can be used to validate documents in which the TEI `<figure>` element contains any valid SVG representation of a graphic, embedded within an `<svg:svg>` element.

22.7 Linking Schemas to XML Documents

Schemas can be linked to XML documents by means of the `<?xml-model?>` processing instruction described in the W3C Working Group Note *Associating Schemas with XML documents* (<http://www.w3.org/TR/xml-model/>). `<?xml-model?>` can be used for any type of schema, and may be used for multiple schemas:

```
<?xml-model href="tei_tite.rng" type="application/xml" ?>
<?xml-model href="checkLinks.sch" type="application/xml" schematypens="http://purl.oclc.org/dsdl/schematron"
?>
<?xml-model href="tei_tite.odd" type="application/tei+xml" schematypens="http://www.tei-c.org/ns/1.0" ?>
```

This example includes a standard RELAX NG schema, a Schematron schema which might be used for checking that all pointing attributes point at existing targets, and also a link to the TEI ODD file from which the RELAX NG schema was generated. See also 2.3.9. *The Schema Specification* for details of another method of linking an ODD specification into your file by including a `<schemaSpec>` element in `<encodingDesc>`.

22.8 Module for Documentation Elements

The module described in this chapter makes available the following components:

Module tagdocs: Documentation of TEI modules

- *Elements defined:* altIdent att attDef attList attRef classRef classSpec classes code constraint constraintSpec content datatype defaultVal eg egXML elementRef elementSpec equiv exemplum gi ident listRef macroRef macroSpec memberOf moduleRef moduleSpec remarks schemaSpec specDesc specGrp specGrpRef specList tag val valDesc valItem valList
- *Classes defined:* att.combinable att.deprecated att.identified att.namespaceable
- *Macros defined:* macro.anyXML macro.schemaPattern

The selection and combination of modules to form a TEI schema is described in 1.2. *Defining a TEI Schema*.

The elements described in this chapter are all members of one of three classes: `model.oddDecl`, `model.oddRef`, or `model.phrase.xml`, with the exceptions of `<schemaSpec>` (a member of `model.divPart`) and both `<eg>` and `<egXML>` (members of `model.common` and `model.egLike`). All of these classes are declared along with the other general TEI classes, in the basic structure module documented in 1. *The TEI Infrastructure*.

In addition, some elements are members of the `att.identified` class, which is documented in 22.5. *Building a Schema* above, and make use of the `macro.schemaPattern` pattern, which is documented in 22.4.4. *Element Specifications* above.

23 Using the TEI

This section discusses some technical topics concerning the deployment of the TEI markup scheme documented elsewhere in these Guidelines. In section 23.3, *Personalization and Customization* we discuss the scope and variety of the TEI customization mechanisms, distinguishing between ‘clean’ modifications, which result in a schema that supports a subset of the distinctions made in the full TEI system, on the one hand, from ‘unclean’ modifications, which result in a schema that does not have this property. In 23.4, *Conformance* we define the notion of *TEI Conformance*, distinguishing between documents which are algorithmically TEI conformant (“TEI Conformable”) from those which are intrinsically conformant (“TEI Conformant”); we also define the concept of a TEI extension. Since the ODD markup description language defined in chapter 22, *Documentation Elements* is fundamental to the way conformance and customization are handled in the TEI system, these two definitional sections are followed by a section (23.5, *Implementation of an ODD System*) which describes the intended behaviour of an ODD processor.

23.1 Serving TEI files with the TEI media type

In February 2011, the media type `application/tei+xml` was registered with IANA for ‘markup languages defined in accordance with the Text Encoding and Interchange guidelines’ (RFC 6129). We recommend that any XML file whose root element is in the TEI namespace be served with the media type `application/tei+xml` to enable and encourage automated recognition and processing of TEI files by external applications.

23.2 Obtaining the TEI Schemas

As discussed in chapter 22, *Documentation Elements*, the modules making up the TEI scheme are generated from a single set of XML source files. Schemas can be generated for TEI customizations in each of XML DTD language, W3C schema language, and RELAX NG schema language. In the body of the Guidelines, only the latter form is presented, using the compact syntax.

The TEI schemas and Guidelines are widely available over the Internet and elsewhere. The canonical home for the TEI source, the schema fragments generated from it, and example modifications, is the TEI repository at <http://tei.sf.net>; versions are also available in other formats, along with copies of the Guidelines and related materials, from the TEI web site at <http://www.tei-c.org>.

23.3 Personalization and Customization

These Guidelines provide an encoding scheme suitable for encoding a very wide range of texts, and capable of supporting a wide variety of applications. For this reason, the TEI scheme supports a variety of different approaches to solving similar problems, and also defines a much richer set of elements than is likely to be necessary in any given project. Furthermore, the TEI scheme may be extended in well-defined and documented ways for texts that cannot be conveniently or appropriately encoded using what is provided. For these reasons, it is almost impossible to use the TEI scheme without customizing or personalizing it in some way.

This section describes how the TEI encoding scheme may be customized, and should be read in conjunction with chapter 22, *Documentation Elements*, which describes how a specific application of the TEI encoding scheme should be documented. The documentation system described in that chapter is, like the rest of the TEI scheme, independent of any particular schema or document type definition language.

Formally speaking, these Guidelines provide both syntactic rules about how elements and attributes may be used in valid documents and semantic recommendations about what interpretation should be attached to a given syntactic construct. In this sense, they provide both a *document type definition* and a *document type declaration*. More exactly, we may distinguish between the *TEI Abstract Model*, which defines a set of related concepts, and the *TEI schema* which defines a set of syntactic rules and constraints. Many (though not all) of the semantic recommendations are provided solely as informal descriptive prose, though some of them are also enforced by means of such constructs as datatypes (see 1.4.2, *Datatype Macros*). Although the descriptions have been written with care, there will inevitably be cases where the intention of the contributors has not been conveyed with sufficient clarity to prevent users of the Guidelines from ‘extending’ them in the sense of attaching slightly variant semantics to them.

Beyond this unintentional semantic extension, some of the elements described can intentionally be used in a variety of ways; for example, the element `<note>` has an attribute type which can take on arbitrary string values, depending on how it is used in a document. A new type of ‘note’, therefore, requires no change in the existing model. On the other hand, for many applications, it may be desirable to constrain the possible values for the type attribute to a small set of

possibilities. A schema modified in this way would no longer necessarily regard as valid the same set of documents as the corresponding unmodified TEI schema, but would remain faithful to the same conceptual model.

This section explains how the TEI scheme can be customized by suppressing elements, modifying classes of elements, adding elements, and renaming elements. Documents which validate against an application of the TEI scheme which has been customized in this way may or may not be considered ‘TEI conformant’, as further discussed in section 23.4. *Conformance*.

The TEI scheme is designed to support modification and customization in a documented way that can be validated by an XML processor. This is achieved by writing a small TEI Conformant document, from which an appropriate processor can generate both human-readable documentation, and a schema expressed in a language such as RELAX NG or DTD. The mechanisms used to instantiate a TEI schema differ for different schema languages, and are therefore not defined here. In XML DTDs, for example, extensive use is made of parameter entities, while in RELAX NG schemas, extensive use is made of patterns. In either case, the names of elements and, wherever possible, their attributes and content models are defined indirectly. The syntax used to implement this indirection also varies with the schema language used, but the underlying constructs in the TEI Abstract Model are given the same names.

As further discussed in section 1. *The TEI Infrastructure*, the TEI encoding scheme comprises a set of class and macro declarations, and a number of *modules*. Each module is made up of element and attribute declarations, and a schema is made by combining a particular set of modules together. In the absence of any other kind of personalization, when modules are combined together:

1. all the elements defined by the module (and described in the corresponding section of these Guidelines) are included in the schema;
2. each such element is identified by the canonical name given it in these Guidelines;
3. the content model of each such element is as defined by these Guidelines;
4. the names, datatypes, and permitted values declared for each attribute associated with each such element are as given in these Guidelines;
5. the elements comprising element classes and the meaning of macro declarations expressed in terms of element classes is determined by the particular combination of modules selected.

The TEI personalization mechanisms allow the user to control this behaviour as follows:

1. particular elements may be suppressed, removing them from any classes in which they are members, and also from any generated schema;
2. within certain limits, the name (generic identifier) associated with an element may be changed, without changing the semantic or syntactic properties of the element;
3. new elements may be added to an existing class, thus making them available in macros or content models defined in terms of those classes;
4. additional attributes, or attribute values, may be specified for an individual element or for classes of elements;
5. within certain limits, attributes, or attribute values, may also be removed either from an individual element or for classes of elements;
6. the characteristics inherited by one class from another class may be modified by modifying its class membership: all members of the class then inherit the changed characteristics;
7. the set of values legal for an attribute or attribute class may be constrained or relaxed by supplying or modifying a value list, or by modifying its datatype.

The modification mechanisms presented in this section are quite general, and may be used to make all the types of changes just listed.

The recommended way of implementing and documenting all such modifications is by means of the ODD system described in chapter 22. *Documentation Elements*; in the remainder of this section we give specific examples to illustrate how that system may be applied. An ODD processor, such as the Roma application supported by the TEI, or any other comparable set of stylesheets will use the declarations provided by an ODD to generate appropriate sets of declarations in a specific schema language such as RELAX NG or the XML DTD language. We do not discuss in detail here how this should be done, since the details are schema language-specific; some background information about the methods

used for XML DTD and RELAX NG schema generation is however provided in section 1.2. *Defining a TEI Schema*. Several example ODD files are also provided as part of the standard TEI release: see further section 23.3.4. *Examples of Modification* below.

23.3.1 Kinds of Modification

For ease of discussion, we distinguish the following different kinds of modification:

1. deletion of elements;
2. renaming of elements;
3. modification of content models;
4. modification of attribute and attribute-value lists;
5. modification of class membership;
6. addition of new elements.

Each of these is described in the following sections.

Each kind of modification changes the set of documents that will be considered valid according to the resulting schema. Any combination of unchanged TEI modules may be thought of as defining a certain set of documents. Each schema resulting from a modified combination of TEI modules will define a different set of documents. The set of documents valid according to the unmodified schema may or may not be properly contained in the set of documents considered to be valid according to the modified schema. We use the term *clean modification* to describe a modification which regards as valid a subset of the documents considered valid by the same combination of TEI modules unmodified. Alternatively, the set of documents considered valid by the original schema might be disjoint from the set of documents considered valid by the modified schema, with neither being properly contained by the other. Modifications that have this result are called *unclean modifications*. Despite this terminology, unclean modifications are not particularly deprecated, and their use may often be vital to the success of a project. The concept is introduced solely to distinguish the effects of different kinds of modification.

Cleanliness can only be assessed with reference to elements in the TEI namespace.

23.3.1.1 Deletion of Elements

The simplest way to modify the supplied modules is to suppress one or more of the supplied elements. This is simply done by setting the mode attribute to delete on an `<elementSpec>` for the element concerned.

For example, if the `<note>` element is not to be used in a particular application, the schema specification concerned will contain a declaration like the following:

```
<elementSpec ident="note" module="core" mode="delete"/>
```

The `ident` attribute here supplies the canonical name of the element to be deleted, the `module` attribute identifies the module in which this element is declared, and the `mode` attribute specifies what is to be done with it. Note that the module name must be supplied explicitly, and that the schema specification in which this declaration appears must also contain a reference to the module itself. The full specification for a schema in which this modification is applied would thus be something like the following:

```
<schemaSpec ident="mySchema">
  <moduleRef key="core"/>
  <!-- other modules used by this schema -->
  <elementSpec ident="note" module="core" mode="delete"/>
</schemaSpec>
```

In most cases, deletion is a clean modification, since most elements are optional. Documents that are valid with respect to the modified schema are also valid according to the unmodified schema. To say this another way, the set of documents matching the new schema is contained by the set of documents matching the original schema.

There are however some elements in the TEI scheme which have mandatory children; for example, the element `<fileDesc>` must contain both a `<titleStmt>` and a `<sourceDesc>`. A modification which deleted either of these would be

unclean, because it would regard as valid documents that the unmodified schema would regard as invalid. Deleting one of the many optional children of <fileDesc> (<editionStmt> or <notesStmt> for example) would not have this effect, and would be a clean modification.

In general, whenever the element deleted by a modification is mandatory within the content model of some other (undeleted) element, the result is an unclean modification, and may also break the TEI Abstract Model (23.4.3. *Conformance to the TEI Abstract Model*). However, the parent of a mandatory child can be safely removed if it is itself optional.

To determine whether or not an element is mandatory in a given context, the user must inspect the content model of the element concerned. In most cases, content models are expressed in terms of model classes rather than elements; hence, removing an element will generally be a clean modification, since there will generally be other members of the class available. If a class is completely depopulated by a modification, then the cleanliness of the modification will depend upon whether or not the class reference is mandatory or optional, in the same way as for an individual element.

23.3.1.2 Renaming of Elements

Every element and other named markup construct in the TEI scheme has a *canonical name*, usually in the English language: this name is supplied as the value of the ident attribute on the <elementSpec>, <attDef>, <classSpec>, or <macroSpec> used to define it. The element or attribute declaration used within a schema generated from that specification may however be different, thus permitting schemas to be written using elements with generic identifiers from a different language, or otherwise modified. There may be many alternative identifiers for the same markup construct, and an ODD processor may choose which of them to use for a given purpose. Each such alternative name is supplied by means of an <altIdent> element within the specification element concerned.

For example, the following declaration converts <note> to <annotation>:

```
<elementSpec ident="note" module="core" mode="change">
  <altIdent>annotation</altIdent>
</elementSpec>
```

Note that the mode attribute on the <elementSpec> now takes the value change to indicate that those parts of the element specification not supplied are to be inherited from the standard definition. The content of the <altIdent> element will be used in place of the canonical ident value in the schema generated.

Renaming in this way is always a *reversible* modification. Although it is an inherently unclean modification (because the set of documents matched by the resulting schema is disjoint with the set matched by its unmodified equivalent), the process of converting any document in which elements have been renamed into an exactly equivalent document using canonical names is completely deterministic, requiring only access to the ODD in which the renaming has been specified. This assumes that the renamed elements used are not placed in the TEI namespace but either use a null namespace or some user-defined namespace, as further discussed in 23.3.2. *Modification and Namespaces*; if this is not the case, care must be taken to avoid name collision between the new name and all existing TEI names. Furthermore, unclean modifications which do not specify a namespace are not conformant (see further 23.3. *Personalization and Customization*).

The TEI provides a systematic set of renamings into languages other than English. These all use a language-specific namespace.

23.3.1.3 Modification of Content Models

The content model for an element in the TEI scheme is defined by means of a <content> element within the <elementSpec> which specifies it. As shown elsewhere in these Guidelines, the content model is defined using RELAX NG syntax, whether the resulting schema is expressed in RELAX NG or in some other schema language.

For example, the specification for the element <term> provided by the Guidelines contains a <content> element like the following:

```
<content>
  <rng:ref name="macro.phraseSeq"/>
</content>
```

This indicates that the content model contains declarations taken from the RELAX NG namespace, and that it consists of a reference to a pattern called macro.phraseSeq. Further examination shows that this pattern in turn expands to an

optional repeatable alternation of text (rng:text) with references to three other classes (model.gLike, model.phrase, or model.global). For some particular application it might be preferable to insist that <term> elements should only contain plain text, excluding these other possibilities.¹²² This could be achieved simply by supplying a specification for <term> like the following:

```
<elementSpec ident="term" module="core" mode="change">
  <content>
    <rng:text/>
  </content>
</elementSpec>
```

This is a clean modification which does not change the meaning of a TEI element; there is therefore no need to assign the element to some other namespace than that of the TEI, though it may be considered good practice; see further 23.3.2. *Modification and Namespaces* below.

A change of this kind, which simplifies the possible content of an element by reducing its model to one of its existing components, is always clean, because the set of documents matched by the resulting schema is a subset of the set of documents which would have been matched by the unmodified schema.

Note that content models are generally defined (as far as possible) in terms of references to model classes, rather than to explicit elements. This means that the need to modify content models is greatly reduced: if an element is deleted or modified, for example, then the deletion or modification will be available for every content model which references that element via its class, as well as those which reference it explicitly. For this reason it is not (in general) good practice to replace class references by explicit element references, since this may have unintended side effects.

An unqualified reference to an element class within a content model generates a content model which is equivalent to an alternation of all the members of the class referenced. Thus, a content model which refers to the model class model.phrase will generate a content model in which any one of the members of that class is equally acceptable. It is also possible to reference predefined content model fragments based on classes, such as ‘an optional repeatable alternation of all members of a class’, ‘a sequence containing no more than one of each member of the class’, etc. as described further in 22.4.6. *Element Classes*.

Content model changes which are not simple restrictions on an existing model should be undertaken with caution. The set of documents matching the schema which results from such changes is likely to be disjoint with the set of documents matching the unmodified schema, and such changes are therefore regarded as unclean. When content models are changed or extended, care should be taken to respect the existing semantics of the element concerned as stated in the Guidelines. For example, the element <l> is defined as containing a line of verse. It would not therefore make sense to redefine its content model so that it could also include members of the class model.pLike: such a modification although syntactically feasible would not be regarded as TEI conformant because it breaks the TEI Abstract Model.

23.3.1.4 Modification of Attribute and Attribute Value Lists

The attributes applicable to a given element may be specified in two ways: they may be given explicitly, by means of an <attList> element within the corresponding <elementSpec>, or they may be inherited from an attribute class, as specified in the <classes> element. To add a new attribute to an element, the schema builder should therefore first check to see whether this attribute is already defined by some existing attribute class. If it is, then the simplest method of adding it will be to make the element in question a member of that class, as further discussed below. If this is not possible, then a new <attDef> element must be added to the existing <attList> for the element in question.

Whichever method is adopted, the modification capabilities are the same as those available for elements. Attributes may be added or deleted from the list, using the mode attribute on <attDef> in the same way as on <elementSpec>. The ‘content’ of an attribute is defined by means of the <datatype>, <valList>, or <valDesc> elements within the <attDef> element. Any of these elements may be changed.

Suppose, for example, that we wish to add two attributes to the <eg> element (used to indicate examples in a text), type to characterize the example in some way, and source to indicate where the example comes from. A quick glance through the Guidelines indicates that the attribute class att.typed could be used to provide the type attribute, but there is no comparable class which will provide a source attribute. The existing <eg> element in fact has no local attributes defined for it at all: we will therefore need to add not only an <attDef> element to define the new attribute, but also an <attList> to hold it.

¹²²Excluding model.gLike is generally inadvisable however, since without it the resulting schema has no way of referencing non-Unicode characters.

We begin by adding the new source attribute:

```
<elementSpec ident="eg" module="tagdocs" mode="change">
  <attList>
    <attDef
      ident="source"
      mode="add"
      ns="http://www.example.com/ns/nonTEI">
      <desc>specifies the source of an example by pointing to a
        single bibliographic reference for it</desc>
      <datatype maxOccurs="1">
        <rng:ref name="data.pointer"/>
      </datatype>
    </attDef>
  </attList>
</elementSpec>
```

The value supplied for the mode attribute on the <attDef> element is add; if this attribute already existed on the element we are modifying this should generate an error, since a specification cannot have more than one attribute of the same name. If the attribute is already present, we can replace the whole of the existing declaration by supplying replace as the value for mode; alternatively, we can change some parts of an existing declaration only by supplying just the new parts, and setting change as the value for mode.

Because the new attribute is not defined by the TEI, we must specify a namespace for it on the <attDef>; see further 23.3.2. *Modification and Namespaces*.

As noted above, adding the new type attribute involves changing this element's class membership; we therefore discuss that in the next section (23.3.1.5. *Class Modification*).

The canonical name for the new attribute is source, and is supplied on the ident attribute of the <attDef> element. In this simple example, we supply only a description and datatype for the new attribute; the former is given by the <desc> element, and the latter by the <datatype> element. (There are of course many other pieces of information which could be supplied, as documented in 22. *Documentation Elements*). The content of the <datatype> element, like that of the <content> element, uses patterns from the RELAX NG namespace, in this case to select one of the predefined TEI datatypes (1.4.2. *Datatype Macros*).

It is often desirable to constrain the possible values for an attribute to a greater extent than is possible by simply supplying a TEI datatype for it. This facility is provided by the <valList> element, which can also appear as a child of the <attDef> element. Suppose for example that, rather than supplying them as pointers to a bibliography, all that we wish to indicate about the source of our examples is that each comes from one of three predefined sources, which we call A, B, and C. A declaration like the following might be appropriate:

```
<elementSpec ident="eg" module="tagdocs" mode="change">
  <attList>
    <attDef
      ident="source"
      ns="http://www.example.com/ns/notTEI"
      mode="add">
      <desc>specifies the source of an example by supplying one of three
        predefined codes for it.</desc>
      <datatype maxOccurs="1">
        <rng:ref name="data.word"/>
      </datatype>
      <valList type="closed">
        <valItem ident="A">
          <desc>Examples taken from the A-list</desc>
        </valItem>
        <valItem ident="B">
          <desc>Examples taken from the B-list</desc>
        </valItem>
      </valList>
    </attDef>
  </attList>
</elementSpec>
```

```

    </valItem>
    <valItem ident="C">
      <desc>Examples taken from the C-list</desc>
    </valItem>
  </valList>
</attDef>
</attList>
</elementSpec>

```

The same technique may be used to replace or extend the <valList> supplied as part of any attribute in the TEI scheme.

Depending on the modification, the set of documents matched by a schema generated from an ODD modified in this way, may or may not be a subset of the set of documents matched by the unmodified schema. As such, it is difficult to tell in principle whether such modifications are intrinsically unclean.

23.3.1.5 Class Modification

The concept of element classes was introduced in 1.3.2. *Model Classes*; an understanding of it is fundamental to successful use of the TEI scheme. As noted there, we distinguish *model classes*, the members of which all have structural similarity, from *attribute classes*, the members of which simply share a set of attributes.

The part of an element specification which determines its class membership is an element called <classes>. All classes to which the element belongs must be specified within this, using a <memberOf> element for each.

To add an element to a class in which it is not already a member, all that is needed is to supply a new <memberOf> element within the <classes> element for the element concerned. For example, to add an element to the att.typed class, we include a declaration like the following:

```

<elementSpec
  ident="eg"
  module="tagdocs"
  mode="change"
  ns="http://www.example.com/ns/notTEI">
  <classes mode="change">
    <memberOf key="att.typed"/>
  </classes>
</elementSpec>

```

Any existing class memberships for the element being changed are not affected because the mode attribute of the <classes> element is set to change (rather than its default value of replace). Consequently, in this case, the <eg> element retains its membership of the two classes (model.common and model.graphicLike) to which it already belongs.

Equally, to remove the attributes which an element inherits from its membership in some class, all that is needed is to remove the relevant <memberOf> element. For example, the element <term> defined in the core module is a member of two attribute classes, att.typed and att.declaring. It inherits the attributes type and subtype from the former, and the attribute decls from the latter. To remove the last of these attributes from this element, we need to remove it from that class:

```

<elementSpec ident="term" module="core" mode="change">
  <classes mode="change">
    <memberOf key="att.declaring" mode="delete"/>
  </classes>
</elementSpec>

```

If the intention is to change the class membership of an element completely, rather than simply add or remove it to or from one or more classes, the value of mode attribute of <classes> can be set to replace (which is the default if no value is specified), indicating that the memberships indicated by its child <memberOf> elements are the only ones applicable. Thus the following declaration:

```
<elementSpec
  ident="term"
  module="core"
  mode="change"
  ns="http://www.example.com/ns/notTEI">
  <classes mode="replace">
    <memberOf key="att.interpLike"/>
  </classes>
</elementSpec>
```

would have the effect of removing the element `<term>` from both its existing attribute classes, and adding it to the `att.interpLike` class.

If however the `mode` attribute is set to `change`, the implication is that the memberships indicated by its child `<memberOf>` elements are to be combined with the existing memberships for the element.

To change or remove attributes inherited from an attribute class for all members of the class (as opposed to specific members of that class), it is also possible to modify the class specification itself. For example, the class `att.global` defines several attributes which are available for all elements, notably `xml:id`, `xml:lang`, `rend`, and `rendition` among others. If we decide that we never wish to use the `rend` attribute, the simplest way of removing it is to supply a modified class specification for `att.global` as follows:

```
<classSpec ident="att.global" type="atts" mode="change">
  <attList>
    <attDef ident="rend" mode="delete"/>
  </attList>
</classSpec>
```

Because the `mode` attribute on the `<classSpec>` defining the attributes inherited through membership of this class has the value `change`, any of its existing identifiable components not specified in the modification above will remain unchanged. The only effect will therefore be to delete the `rend` attribute from the class, and hence from all elements which are members of the class.

The classes used in the TEI scheme are further discussed in chapter 1. *The TEI Infrastructure*. Note in particular that classes are themselves classified: the attributes inherited by a member of attribute class A may come to it directly from that class, or from another class of which A is itself a member. For example, the class `att.global` is itself a member of the classes `att.global.linking` and `att.global.analytic`. By default, these two classes are predefined as empty. However, if (for example) the `linking` module is included in a schema, a number of attributes (`corresp`, `sameAs`, etc.) are defined as members of the `att.global.linking` class. All elements which are members of `att.global` will then inherit these new attributes (see further section 1.3.1. *Attribute Classes*). A new attribute may thus be added to the global class in two ways: either by adding it to the `<attList>` defined within the class specification for `att.global`; or by defining a new attribute class, and changing the class membership of the `att.global` class to reference it.

Such global changes should be undertaken with caution: in general removing existing non-mandatory attributes from a class will always be a clean modification, in the same way as removing non-mandatory elements. Adding a new attribute to a class however can be a clean modification only if the new attribute is labelled as belonging to some namespace other than the TEI.

The same mechanisms are available for modification of model classes. Care should be taken when modifying the model class membership of existing elements since model class membership is what determines the content model of most elements in the TEI scheme, and a small change may have unintended consequences.

23.3.1.6 Addition of New Elements

To add a completely new element into a schema involves providing a complete element specification for it, the `<classes>` element of which includes a reference to at least one TEI model class. Without such a reference, the new element will not be referenced by the content model of any other TEI element, and will therefore be inaccessible within a TEI document.

For example, the three elements `<bibl>`, `<biblFull>`, and `<biblStruct>` are all defined as members of the class `model.biblLike`. To add a fourth member (say `<myBibl>`) to this class, we need to include in the `<elementSpec>` defining our new element a `<memberOf>` element which nominates the intended class:

```

<elementSpec
  ident="myBibl"
  mode="add"
  ns="http://www.example.com/ns/notTEI">
  <classes>
    <memberOf key="model.biblLike"/>
  </classes>
  <!-- other parts of the new declaration here -->
</elementSpec>

```

The other parts of this declaration will typically include a description for the new element and information about its content model, its attributes, etc., as further described in 22. *Documentation Elements*.

23.3.2 Modification and Namespaces

All the elements defined by the TEI scheme are labelled as belonging to a single *namespace*, maintained by the TEI and with the URI <http://www.tei-c.org/ns/1.0>.¹²³ Only elements which are unmodified or which have undergone a clean modification may use this namespace. In a TEI-conformant document, it is assumed that all attributes not explicitly labelled with a namespace (such as, for example `xml:id`) also belong to the TEI namespace, and are defined by the TEI.

This implies that any other modification (including a renaming or reversible modification) must either specify a different namespace or specify no namespace at all. The `ns` attribute is provided on elements `<schemaSpec>`, `<elementSpec>`, and `<attDef>` for this purpose.

Suppose, for example, that we wish to add a new attribute topic to the existing TEI element `<p>`. In the absence of namespace considerations, this would be an unclean modification, since `<p>` does not currently have such an attribute. The most appropriate action is to explicitly attach the new attribute to a new namespace by a declaration such as the following:

```

<elementSpec ident="p" mode="change">
  <attList>
    <attDef ident="topic" mode="add" ns="http://www.example.org/ns/nonTEI">
      <desc>indicates the topic of a TEI paragraph</desc>
      <datatype>
<!-- ... -->
      </datatype>
    </attDef>
  </attList>
</elementSpec>

```

Document instances using a schema derived from this ODD can now indicate clearly the status of this attribute:

```

<div
  xmlns:my="http://www.example.org/ns/nonTEI">
<!-- ... -->
  <p n="12" my:topic="rabbits">Flopsy, Mopsy, Cottontail, and
    Peter...</p>
</div>

```

Since `topic` is explicitly labelled as belonging to something other than the TEI namespace, we regard the modification which introduced it as clean. A namespace-aware processor will be able to validate those elements in the TEI namespace against the unmodified schema.¹²⁴

¹²³This is not strictly the case, since the element `<egXML>` used to represent TEI examples has its own namespace, <http://www.tei-c.org/ns/Examples>; this is the only exception however.

¹²⁴Full namespace support does not exist in the DTD language, and therefore these techniques are available only to users of more modern schema languages such as RELAX NG or W3C Schema.

Similar considerations apply when modification is made to the content model or some other aspect of an element, or when a new element is declared. Clean modification requires that all such changes be explicitly labelled as belonging to some non-TEI name space or to no name space at all.

If the `ns` attribute is supplied on a `<schemaSpec>` element, it identifies the namespace applicable to all components of the schema being specified. Even if such a schema includes unmodified modules from the TEI namespace, the elements contained by such modules will now be regarded as belonging to the namespace specified on the `<schemaSpec>`. This can be useful if it is desired simply to avoid namespace processing. For example, the following schema specification results in a schema called `noName` which has no namespace, even though it comprises declarations from the TEI header module:

```
<schemaSpec ns="" ident="noName">
  <moduleRef key="header"/>
  <!-- ... -->
</schemaSpec>
```

In addition to the TEI canonical namespace mentioned above, the TEI may also define namespaces for approved translations of the TEI scheme into other languages. These may be used as appropriate to indicate that a customization uses a standardized set of renamings. The namespace for such translations is the same as that for the canonical namespace, suffixed by the appropriate ISO language identifier (*vi.1 Language identification*). A schema specification using the Chinese translation, for example, would use the namespace `http://www.tei-c.org/ns/1.0/zh`

23.3.3 Documenting the Modification

The elements used to define a TEI customization (`<schemaSpec>`, `<moduleRef>`, `<elementSpec>`, etc.) will typically be used within a TEI document which supplies further information about the intended use of the new schema, the meaning and application of any new or modified elements within it, and so on. This document will typically conform to a TEI (or other) schema which includes the module described in chapter 22. *Documentation Elements*.¹²⁵

Where the customization to be documented simply consists in a selection of modules, perhaps with some deletion of unwanted elements or attributes, the documentation need not specify anything further. Even here however it may be considered worthwhile to replace some of the semantic information provided by the unmodified TEI specification. For example, the `<desc>` element of an unmodified TEI `<elementSpec>` may describe an element in terms more general than appropriate to a particular project, or the `<exemplum>` elements within it may not illustrate the project's actual intended usage of the element, or the `<remarks>` element may contain discussions of matters irrelevant to the project. These elements may therefore be replaced or deleted within an `<elementSpec>` as necessary.

Radical revision is also possible. It is feasible to produce a modification in which the `<teiHeader>` or `<text>` elements are not required, or in which any other rule stated in these Guidelines is either not enforced or not enforceable. In fact, the mechanism, if used in an extreme way, permits replacement of all that the TEI has to say about every component of its scheme. Such revisions would result in documents that are not TEI conformant in even the broadest sense, and it is not intended that encoders use the mechanism in this way. We discuss exactly what is meant by the concept of *TEI conformance* in the next section, 23.4. *Conformance*.

23.3.4 Examples of Modification

Several examples of customizations of the TEI are provided as part of the standard release. They include the following:

tei_bare The schema generated from this customization is the minimum needed for TEI Conformance. It provides only a handful of elements.

tei_all The schema generated from this customization combines all available TEI modules, providing 543 elements.

tei_allPlus The schema generated from this customization combines all available TEI modules with three other non-TEI vocabularies, specifically MathML, SVG, and XInclude.

It is unlikely that any project would wish to use any of these extremes unchanged. However, they form a useful starting point for customization, whether by removing modules from `tei_all` or `tei_allPlus`, or by replacing elements deleted from `tei_bare`. They also demonstrate how an ODD document may be constructed to provide a basic reference manual to accompany schemas generated from it.

¹²⁵This module can be used to document any XML schema, and has indeed been used to document several non-TEI schemas.

Shortly after publication of the first edition of these Guidelines, as a demonstration of how the TEI encoding scheme might be adopted to meet 90% of the needs of 90% of the TEI user community, the TEI editors produced a brief tutorial defining one specific ‘clean’ modification of the TEI scheme, which they called TEI Lite. This tutorial and its associated DTD became very popular and are still available from the TEI web site at <http://www.tei-c.org/Guidelines/Customization/Lite/>. The tutorial and associated schema specification is also included as one of the exemplars provided with TEI P5.

The exemplars provided with TEI P5 also include a customization file from which a schema for the validation of other customization files may be generated. This ODD, called *tei_odds*, combines the four basic modules with the tagdocs, dictionaries, gaiji, linking, and figures modules as well as including the (non-TEI) module defining the RELAX NG language. This enables schemas derived from this customization file to validate examples contained within them in a number of ways, further described within the document.

23.4 Conformance

The notion of *TEI Conformance* is intended to assist in the description of the format and contents of a particular XML document instance or set of documents. It may be found useful in such situations as:

- interchange or integration of documents amongst different researchers or users;
- software specifications for TEI-aware processing tools;
- agreements for the deposit of texts in, and distribution of texts from, archives;
- specifying the form of documents to be produced by or for a given project.

It is not intended to provide any other evaluation, for example of scholarly merit, intellectual integrity, or value for money. A document may be of major intellectual importance and yet not be TEI Conformant; a TEI Conformant document may be of no scholarly value whatsoever.

In this section we explore several aspects of conformance, and in particular attempt to define how the term *TEI Conformant* should be used. The terminology defined here should be considered normative: users and implementors of the TEI Guidelines should use the phrases ‘TEI Conformant’, ‘TEI Conformable’, and ‘TEI Extension’ only in the senses given and with the usages described.

A document is *TEI Conformant* if it:

- is a well-formed XML document (23.4.1. *Well-formedness criterion*)
- can be validated against a *TEI Schema*, that is, a schema derived from the TEI Guidelines (23.4.2. *Validation Constraint*)
- conforms to the TEI Abstract Model (23.4.3. *Conformance to the TEI Abstract Model*)
- uses the *TEI Namespace* (and other namespaces where relevant) correctly (23.4.4. *Use of the TEI Namespace*)
- is documented by means of a TEI Conformant ODD file (23.4.5. *Documentation Constraint*) which refers to the TEI Guidelines

Each of these criteria is discussed in more detail below.

A document is said to be *TEI Conformable* if it is a well-formed XML document which can be transformed algorithmically and automatically into a TEI Conformant document as defined above without loss of information. Such a document may informally be described as TEI conformant; the terms *algorithmically conformant* or *TEI Conformable* are provided in order to distinguish documents exhibiting these kinds of conformance from others.

A document is said to use a *TEI Extension* if it is a well-formed XML document which is valid against a TEI Schema which contains additional distinctions, representing concepts not present in the TEI Abstract Model, and therefore not documented in these Guidelines. Such a document cannot, in general, be algorithmically conformant since it cannot be automatically transformed without loss of information. However, since one of the goals of the TEI is to support extensions and modifications, it should not be assumed that no TEI document can include extensions: an extension which is expressed by means of the recommended mechanisms is also a TEI document provided that those parts of it which are not extensions are TEI Conformant, or Conformable.

A TEI Conformant (or Conformable) document is said to follow *TEI Recommended Practice* if, wherever the Guidelines prefer one encoding practice to another, the preferred practice is used.

23.4.1 Well-formedness criterion

These Guidelines mandate the use of well-formed XML as representation format. Documents must conform to the World Wide Web Consortium recommendation of the *Extensible Markup Language (XML) 1.0 (Fourth Edition)* or successor

editions found at <http://www.w3.org/TR/xml/>. Other ways of representing the concepts of the TEI Abstract Model are possible, and other representations may be considered appropriate for use in particular situations (for example, for data capture, or project-internal processing). But such alternative representations are at best ‘TEI Conformable’, and cannot be considered in any way TEI Conformant.

Previous versions of these Guidelines used SGML as a representation format. With the release of P5, the only representation format supported by these Guidelines became valid XML; legacy documents in SGML format should therefore be converted using appropriate software.

A TEI Conformant document must use the TEI namespace, and therefore must also include an XML-conformant namespace declaration, as defined below (23.4.4. *Use of the TEI Namespace*).

The use of XML greatly reduces the need to consider hardware or software differences between processing environments when exchanging data. No special packing or interchange format is required for an XML document, beyond that defined by the W3C recommendations, and no special ‘interchange’ format is therefore proposed by these Guidelines. For discussion of encoding issues that may arise in the processing of special character sets or non-standard writing systems, see further chapter *vi Languages and Character Sets*.

In addition to the well-formedness criterion, the W3C defines the notion of a *valid* document, as being a well-formed document which matches a specific set of rules or syntactic constraints, defined by a *schema*. As noted above, TEI conformance implies that the schema used to determine validity of a given document should be derived from the present Guidelines, by means of an ODD which references and documents the schema fragments which the Guidelines define.

23.4.2 Validation Constraint

All *TEI Conformant* documents must validate against a schema file that has been derived from the published TEI Guidelines, combined and documented in the manner described in section 23.3. *Personalization and Customization*. We call the formal output of this process a *TEI Schema*.

The TEI does not mandate use of any particular schema language, only that this schema¹²⁶ should have been generated from a *TEI ODD file* that references the TEI Guidelines. Currently available tools permit the expression of schemas in any or all of the XML DTD language, W3C XML Schema, and RELAX NG (both compact and XML formats). Some of what is syntactically possible using the ODD formalism cannot be represented by all schema languages; and there are some features of some schema languages which have no counterpart in ODD. No single schema language fully captures all the constraints implied by conformance to the TEI Abstract Model. A document which is valid according to a TEI schema represented using one schema language may not be valid against the same schema expressed in other languages; in particular the DTD language does not fully support namespaces. Features which cannot be represented in all schema languages are documented in chapters 22. *Documentation Elements* and 23.5. *Implementation of an ODD System*.

As noted in section 23.3. *Personalization and Customization*, many varieties of TEI schema are possible and not all of them are necessarily *TEI Conformant*; derivation from an ODD is a necessary but not a sufficient condition for TEI Conformance.

23.4.3 Conformance to the TEI Abstract Model

The *TEI Abstract Model* is the conceptual schema instantiated by the TEI Guidelines. These Guidelines define, both formally and informally, a set of abstract concepts such as ‘paragraph’ or ‘heading’, and their structural relationships, for example stating that ‘paragraph’s do not contain ‘heading’s. These Guidelines also define classes of elements, which have both semantic and structural properties in common. Those semantic and structural properties are also a part of the TEI Abstract Model; the class membership of an existing TEI element cannot therefore be changed without changing the model. Elements can however be removed from a class by deletion, and new non-TEI elements within their own namespaces can be added to existing TEI classes.

23.4.3.1 Semantic Constraints

It is an important condition of TEI conformance that elements defined in the TEI Guidelines as having one specific meaning should not be used with another. For example, the element <l> is defined in the TEI Guidelines as containing a line of verse. A schema in which it is redefined to mean a typographic line, or an ordered queue of objects of some kind, cannot therefore be TEI Conformant, whatever its other properties.

¹²⁶Here and elsewhere we use the word *schema* to refer to any formal document grammar language, irrespective of the formalism used to represent it.

The semantics of elements defined in the TEI Guidelines are conveyed in a number of ways, ranging from formally verifiable datatypes to informal descriptive prose. In addition, a mapping between TEI elements and concepts in other conceptual models may be provided by the <equiv> element where this is available.

A schema which shares equivalent concepts to those of the TEI conceptual model may be mappable to the TEI Schema by means of such a mechanism. For example, the concept of paragraph expressed in the TEI scheme by the <p> element is probably the same concept as that expressed in the DocBook scheme by the <para> element. In this respect (though not in others) a DocBook-conformant document might therefore be considered to be TEI Conformable. Such areas of overlap facilitate interoperability, because elements from one namespace may be readily integrated with those from another, but do not affect the definition of conformance.

A document is said to conform to the *TEI Abstract Model* if features for which an encoding is proposed by the TEI Guidelines are encoded within it using the markup and other syntactic properties defined by means of a valid *TEI Conformant* schema. Hence, even though the names of elements or attributes may vary, a TEI Conformant document must respect the TEI Semantic Model, and be valid with respect to a TEI Conformant Schema. Although it may be possible to transform a document which follows the *TEI Abstract Model* into a *TEI Conformant* document, such a document is not itself necessarily conformant.

23.4.3.2 Mandatory Components of a TEI Document

It is a long-standing requirement for any *TEI Conformant* document that it should contain a <teiHeader> element. To be more specific a *TEI Conformant* document must contain either:

- a single <teiHeader> element followed by a single <text> element, in that order; or
- in the case of a corpus or collection, a single overall <teiHeader> element followed by a series of <TEI> elements each with its own <teiHeader>

All <teiHeader> elements in a *TEI Conformant* document must include elements for:

Title Statement This should include the title of the TEI document expressed using a <titleStmt> element.

Publication Statement This should include the place and date of publication or distribution of the TEI document, expressed using the <publicationStmt> element.

Source Statement For a document derived from some previously existing document, this must include a bibliographic description of that source. For a document not so derived, this must include a brief statement that the document has no pre-existing source. In either case, this will be expressed using the <sourceDesc> element.

23.4.4 Use of the TEI Namespace

The Namespaces Recommendation of the W3C (Bray et al. (eds.) (2006)) provides a way for an XML document to combine markup from different vocabularies without risking name collision and consequent processing difficulties. While the scope of the TEI is large, there are many areas in which it makes no particular recommendation, or where it recommends that other defined markup schemes should be adopted, such as graphics or mathematics. It is also considered desirable that users of other markup schemes should be able to integrate documents using TEI markup with their own system. To meet these objectives without compromising the reliability of its encoding, a TEI Conformant document is required to make appropriate use of the TEI namespace.

Essentially all elements in a TEI Schema which represents concepts from the TEI Abstract Model belong to the TEI namespace, <http://www.tei-c.org/ns/1.0>, maintained by the TEI. A TEI Conformant document is required to declare the namespace for all the elements it contains whether these come from the TEI namespace or from other schemes.

A TEI Schema may be created which assigns TEI elements to some other namespace, or to no namespace at all. A document using such a schema must be regarded as a TEI extension and cannot be considered TEI Conformant, though it may be TEI Conformable. A document which places non-TEI elements or attributes within the TEI namespace cannot be TEI Conformant; such practices are strongly deprecated as they may lead to serious difficulties for processing or interchange.

23.4.5 Documentation Constraint

As noted in 23.4.2. *Validation Constraint* above, a TEI Schema can only be generated from a TEI ODD, which also serves to document the semantics of the elements defined by it. A TEI Conformant document should therefore always be accompanied by (or refer to) a valid *TEI ODD file* specifying which modules, elements, classes, etc. are in use together with any modifications or renamings applied, and from which a TEI Schema can be generated to validate the document. The TEI supplies a number of predefined *TEI Customization exemplar ODD files* and the schemas already generated from

them (see 23.3.4. *Examples of Modification*), but most projects will typically need to customize the TEI beyond what these examples provide. It is assumed, for example, that most projects will customize the TEI scheme by removing those elements that are not needed for the texts they are encoding, and by providing further constraints on the attribute values and element content models the TEI provides. All such customizations must be specified by means of a valid *TEI ODD* file.

As different sorts of customization have different implications for the interchange and interoperability of TEI documents, it cannot be assumed that every customization will necessarily result in a schema that validates only TEI Conformant documents. The ODD language permits modifications which conflict with the TEI Abstract Model, even though observing this model is a requirement for TEI Conformance. The ODD language can in fact be used to describe many kinds of markup scheme, including schemes which have nothing to do with the TEI at all.

Equally, it is possible to construct a TEI Schema which is identical to that derived from a given TEI ODD file without using the ODD scheme. A schema can be constructed simply by combining the predefined schema language fragments corresponding with the required set of TEI modules and other statements in the relevant schema language. The status of such a schema with respect to the *tei_all* schema cannot however be determined, in general; it may therefore be impossible to determine whether such a schema represents a clean modification or an extension. This is one reason for making the presence of a TEI ODD file a requirement for conformance.

23.4.6 Varieties of TEI Conformance

The conformance status of a given document may be assessed by answering the following questions, in the order indicated:

1. Is it a valid XML document, for which a TEI Schema exists? If not, then the document cannot be considered TEI Conformant in any sense.
2. Is the document accompanied by a TEI Conformant ODD specification describing its markup scheme and intended semantics? If not, then the document can only be considered TEI Conformant if it validates against a predefined TEI Schema and conforms to the TEI abstract model.
3. Does the markup in the document correctly represent the TEI abstract model? Though difficult to assess, this is essential to TEI conformance.
4. Does the document claim that all of its elements come from some namespace other than the TEI (or no namespace)? If so, the document cannot be TEI Conformant, though it may be TEI Conformable.
5. If the document claims to use the TEI namespace, in part or wholly, do the elements associated with that namespace in fact belong to it? If not, the document cannot be TEI Conformant; if so, and if all non-TEI elements and attributes are correctly associated with other namespaces, then the document may be TEI Conformant.
6. Is the document valid according to a schema made by combining all TEI modules as well as valid according to the schema derived from its associated ODD specification? If so, the document is TEI Conformant.
7. Is the document valid according to the schema derived from its associated ODD specification, but not according to *tei_all*? If so, the document uses a TEI extension.
8. Is it possible automatically to transform the document into a document which is valid according to *tei_all*, using only information supplied in the accompanying ODD and without loss of information? If so, the document is TEI Conformable.

In the following table, we examine more closely some specific, though imaginary, cases:

	A	B	C	D	E	F	G	H
Conforms to TEI Abstract Model	Y	N	Y	Y	?	Y	N	?
Valid ODD present	Y	Y	Y	Y	Y	Y	Y	N
Uses only non-TEI namespace(s) or none	N	N	N	N	Y	N	Y	N
Uses TEI and other namespaces correctly	Y	Y	N	Y	N	Y	N	Y
Document is valid as a subset of <i>tei_all</i>	Y	N	Y	N	N	Y	N	Y
Document can be converted automatically to a form which is valid as a subset of <i>tei_all</i>	Y	N	Y	N	N	Y	N	?

We assume firstly that each sample document assessed here is a well-formed XML document, and that it is valid against some schema.

The document in column A is TEI Conformant. Its tagging follows the TEI Abstract Model, both as regards syntactic constraints (its `<l>` elements appear within `<div>` elements and not the reverse) and semantic constraints (its `<l>` elements appear to contain verse lines rather than typographic ones). It is accompanied by a valid ODD which documents exactly how it uses the TEI. All the TEI-defined elements and attributes in the document are placed in the TEI namespace. The schema against which it is valid is a ‘clean’ subset of the `tei_all` schema.

The document in column B is not a TEI document. Although it is accompanied by a valid TEI ODD, the resulting schema includes some ‘unclean’ modifications, and represents some concepts from the TEI Abstract Model using non-TEI elements; for example, it re-defines the content model of `<p>` to permit `<div>` within it, and it includes an element `<pageTrimming>` which appears to have the same meaning as the existing TEI `<fw>` element, but the equivalence is not made explicit in the ODD. It uses the TEI namespace correctly to identify the TEI elements it contains, but the ODD does not contain enough information automatically to convert its non-TEI elements into TEI equivalents.

The document in column C is TEI Conformable. It is almost the same as the document in column A, except that the names of the elements used are not those specified by the TEI namespace. Because the ODD accompanying it contains an exact mapping for each element name (using the `<altIdent>` element) and there are no name conflicts, it is possible to make an automatic conversion of this document.

The document in column D is a TEI Extension. It combines elements from its own namespace with unmodified TEI elements in the TEI namespace. Its usage of TEI elements conforms to the TEI Abstract Model. Its ODD defines a new `<blort>` element which has no exact TEI equivalent, but which is assigned to an existing TEI class; consequently its schema is not a clean subset of `tei_all`. If the associated ODD provided a way of mapping this element to an existing TEI element, then this would be TEI Conformable.

The document in column E is superficially similar to document D, but because it does not use any namespace declarations (or, equivalently, it assigns unmodified TEI elements to its own namespace), it may contain name collisions; there is no way of knowing whether a `<p>` within it is the same as the TEI’s `<p>` or has some other meaning. The accompanying ODD file may be used to provide the human reader with information about equivalently named elements in the TEI namespace, and hence to determine whether the document is valid with respect to the TEI Abstract Model but this is not an automatable process. In particular, cases of apparent conflict (for example use of an element `<p>` to represent a concept not in the TEI Abstract Model but in the abstract model of some other system, whose namespace has been removed as well) cannot be reliably resolved. By our current definition therefore, this is not a TEI document.

The document in column F is TEI Conformable. The difference between it and that in column D is that the new element `<blort>` which is used in this document is a specialization of an existing TEI element, and the ODD in which it is defined specifies the mapping (a `<my:blort>` may be automatically converted to a `<tei:seg type="blort">`, for example). For this to work, however, the `<blort>` must observe the same syntactic constraints as the `<seg>`; if it does not, this would also be a case of TEI Extension.

The document in column G is not a TEI document. Its structure is fully documented by a valid TEI ODD, but it does not claim to represent the TEI Abstract Model, does not use the TEI namespace, and is not intended to validate against any TEI schema.

The document in column H is very like that in column A, but it lacks an accompanying ODD. Instead, the schema used to validate it is produced simply by combining TEI schema fragments in the same way as an ODD processor would, given the ODD. If the resulting schema is a clean subset of `tei_all`, such a document is indistinguishable from a TEI Conformant one, but there is no way of determining (without inspection) whether this is the case if any modification or extension has been applied. Its status is therefore, like that of Text E, impossible to determine.

23.5 Implementation of an ODD System

This section specifies how a processing system may take advantage of the markup specification elements documented in chapter 22. *Documentation Elements* of these Guidelines in order to produce project specific user documentation, schemas in one or more schema languages, and validation tools for other processors.

The specifications in this section are illustrative but not normative. Its function is to further illustrate the intended scope and application of the elements documented in chapter 22. *Documentation Elements*, since it is believed that these may have application beyond the areas directly addressed by the TEI.

An ODD processing system has to accomplish two main tasks. A set of selections, deletions, changes, and additions supplied by an ODD customization (as described in 23.3. *Personalization and Customization*) must first be merged with

the published TEI P5 ODD specifications. Next, the resulting unified ODD must be processed to produce the desired outputs.

An ODD processor is not required to do these two stages in sequence, but that may well be the simplest approach; the ODD processing tools currently provided by the TEI Consortium, which are also used to process the source of these Guidelines, adopt this approach.

23.5.1 Making a Unified ODD

An ODD customization must contain a single `<schemaSpec>` element, which defines the schema to be constructed.

`<schemaSpec>` (schema specification) generates a TEI-conformant schema and documentation for it.

@start specifies entry points to the schema, i.e. which elements may be used as the root of documents conforming to it.

@prefix specifies a default prefix which will be prepended to all patterns relating to TEI elements, unless otherwise stated.

@targetLang (target language) specifies which language to use when creating the objects in a schema if names for elements or attributes are available in more than one language

@docLang (documentation language) specifies which languages to use when creating documentation if the description for an element, attribute, class or macro is available in more than one language

Amongst other attributes inherited from the `att.identified` class, this element also carries a required `ident` attribute. This provides a name for the generated schema, which other components of the processing system may use to refer to the schema being generated, e.g. in issuing error messages or as part of the generated output schema file or files. The `ns` attribute may be used to specify the default namespace within which elements valid against the resulting schema belong, as discussed in 23.3.2. *Modification and Namespaces*.

The `<schemaSpec>` element contains an unordered series of specialized elements, each of which is of one of the following four types:

specifications elements from the class `model.oddDecl` (by default `<elementSpec>`, `<classSpec>`, `<moduleSpec>`, and `<macroSpec>`); these must have a `mode` attribute which determines how they will be processed.¹²⁷ If the value of `mode` is `add`, then the object is simply copied to the output, but if it is `change`, `delete`, or `replace`, then it will be looked at by other parts of the process.

references to specifications `<specGrpRef>` elements refer to `<specGrp>` elements that occur elsewhere in this, or another, document. A `<specGrp>` element, in turn, groups together a set of ODD specifications (among other things, including further `<specGrpRef>` elements). The use of `<specGrp>` and `<specGrpRef>` permits the ODD markup to occur at the points in documentation where they are discussed, rather than all inside `<schemaSpec>`. The `target` attribute of any `<specGrpRef>` should be followed, and the `<elementSpec>`, `<classSpec>`, and `<macroSpec>`, elements in the corresponding `<specGrp>` should be processed as described in the previous item; `<specGrpRef>` elements should be processed as described here.

references to TEI Modules `<moduleRef>` elements with key attributes refer to components of the TEI. The value of the key attribute matches the `ident` attribute of the `<moduleSpec>` element defining a TEI module. The key must be dereferenced by some means, such as reading an XML file with the TEI ODD specification (either from the local hard drive or off the Web), or looking up the reference in an XML database (again, locally or remotely); whatever means is used, it should return a stream of XML containing the element, class, and macro specifications collected together in the specified module. These specification elements are then processed in the same way as if they had been supplied directly within the `<schemaSpec>` being processed.

references to external modules a `<moduleRef>` element may also refer to a compatible external module by means of its `url` attribute; the content of such modules, which must be available in the RELAX NG XML syntax, are passed directly and without modification to the output schema when that is created.

Each object obtained from the TEI ODD specification using `<moduleRef>` by means of the key attribute must be checked against objects in the customization `<schemaSpec>` according to the following rules:

1. if there is an object in the ODD customization with the same value for the `ident` attribute, and a `mode` value of `delete`, then the object from the module is ignored;

¹²⁷ An ODD processor should recognize as erroneous such obvious inconsistencies as an attempt to include an `<elementSpec>` in `add` mode for an element which is already present in an imported module.

2. if there is an object in the ODD customization with the same value for the ident attribute, and a mode value of replace, then the object from the module is ignored, and the one from the ODD customization is used in its place;
3. if there is an object in the ODD customization with the same value for the ident attribute, and a mode value of change, then the two objects must be merged, as described below;
4. if there is an object in the ODD customization with the same value for the ident attribute, and a mode value of add, then an error condition should be raised;
5. otherwise, the object from the module is copied to the result.

To merge two objects with the same ident, their component attributes and child elements must be looked at recursively. Each component may fall into one of the following four categories:

1. Some components may occur only once within the merged object (for example attributes, and <altIdent>, <content>, or <classes> elements). If such a component is found in the ODD customization, it will be copied to the output; if it is not found there, but is present in the TEI ODD specification, then that will be copied to the output.
2. Some components are grouping objects (<attList>, <valList>, for example); these are always copied to the output, and their children are then processed following the rules given in this list.
3. Some components are ‘identifiable’: this means that they are members of the att.identified class from which they inherit the ident attribute; examples include <attDef> and <valItem>. A component of this type will be processed according to its mode attribute, following the rules given above.
4. Some components may occur multiple times, but are neither grouped nor identifiable. Examples include the members of model.glossLike such as <equiv>, <desc>, <gloss>, the <exemplum>, <remarks>, <listRef>, <datatype> or <defaultVal> elements. These should be copied from both the TEI ODD specification and the ODD customization, and all occurrences included in the output.

A special problem arises with elements which are members of attribute classes, as they are permitted to override attributes inherited from a class. For example, consider this simple modification:

```
<elementSpec ident="p">
  <classes>
    <memberOf key="att.typed"/>
  </classes>
  <content>
<!-- ... -->
  </content>
</elementSpec>
```

The effect of its membership in the att.typed class is to provide <p> with a type attribute and a subtype attribute. If we wish <p> to *not* have subtype, we could extend the customization in our schema as follows:

```
<elementSpec ident="p">
  <classes>
    <memberOf key="att.typed"/>
  </classes>
  <content>
<!-- ... -->
  </content>
  <attList>
    <attDef ident="subtype" mode="delete"/>
  </attList>
</elementSpec>
```

This means that when <memberOf key="att.typed"/> is processed, that class is looked up, each attribute which it defines is examined in turn, and the customization is searched for an override. If the modification is of the attribute class itself,

work proceeds as usual; if, however, the modification is at the element level, the class reference is deleted and a series of <attRef> elements is added to the element, one for each attribute inherited from the class. Since attribute classes can themselves be members of other attribute classes, membership must be followed recursively.

The effect of the concatenation of unidentifiable components should be considered carefully. An original may have

```
<elementSpec ident="p">
  <desc>marks paragraphs in prose.</desc>
<!--...-->
</elementSpec>
```

which would usefully be extended with this:

```
<elementSpec ident="p" mode="change">
  <desc xml:lang="es">marca párrafos en prosa.</desc>
<!--...-->
</elementSpec>
```

to provide an alternate description in another language. Nothing prevents the user from supplying <desc> several times in the same language, and subsequent applications will have to decide what that may mean.

Similar considerations apply to multiple example elements, though these are less likely to cause problems in documentation. Note that existing examples can only be deleted by supplying a completely new <elementSpec> in replace mode, since the <exemplum> element is not identifiable.

In the processing of the content models of elements and the content of macros, deleted elements may require special attention.¹²⁸ A content model like this:

```
<elementSpec ident="person">
<!--...-->
  <content>
    <rng:choice>
      <rng:oneOrMore>
        <rng:ref name="model.pLike"/>
      </rng:oneOrMore>
      <rng:zeroOrMore>
        <rng:choice>
          <rng:ref name="model.personPart"/>
          <rng:ref name="model.global"/>
        </rng:choice>
      </rng:zeroOrMore>
    </rng:choice>
  </content>
<!--...-->
</elementSpec>
```

requires no special treatment because everything is expressed in terms of model classes; if deletions result in model.personPart having no members, then model.global is left as the only child of <rng:choice>. An ODD processor may or may not elect to simplify the resulting choice between nothing and model.global by removing the wrapper <rng:choice> element. However, such simplification may be considerably more complex in the general case (if for example the <rng:choice> is itself inside an <rng:zeroOrMore> inside a <rng:group>), and an ODD processor is therefore likely to be more successful in carrying out such simplification as a distinct stage during processing of ODD sources.

If an element refers directly to an element child, like this:

¹²⁸The carthago program behind the Pizza Chef application, written by Michael Sperberg-McQueen for TEI P3 and P4, went to very great efforts to get this right. The XSLT transformations used by the P5 Roma application are not as sophisticated, partly because the RELAX NG language is more forgiving than DTDs.

```

<elementSpec ident="figure">
<!--...-->
  <content>
    <rng:zeroOrMore>
      <rng:choice>
        <rng:ref name="model.pLike"/>
        <rng:ref name="model.global"/>
        <rng:ref name="figure"/>
        <rng:ref name="figDesc"/>
        <rng:ref name="model.graphicLike"/>
        <rng:ref name="model.headLike"/>
      </rng:choice>
    </rng:zeroOrMore>
  </content>
<!--...-->
</elementSpec>

```

and `<figDesc>` has been deleted,¹²⁹ it will be necessary to remove that reference, or the resulting schema will be invalid. Surrounding constructs, such as a `<rng:zeroOrMore>` (which cannot be empty), may also have to be removed.

The result of the work carried out should be a new `<schemaSpec>` which contains a complete and internally consistent set of element, class, and macro specifications, possibly also including `<moduleRef>` elements with url attributes identifying external modules.

23.5.2 Generating Schemas

Assuming that any modifications have been resolved, as outlined in the previous section, making a schema is now a four stage process:

1. all datatype and other macro specifications must be collected together and declared at the start of the output schema;
2. all classes must be declared in the right order (since some classes reference others, the order is significant);
3. all elements are declared;
4. any `<moduleRef>` elements with a url attribute identifying an external schema must be processed.

Working in this order gives the best chance of successfully supporting all the schema languages. However, there are a number of obstacles to overcome along the way.

An ODD processor may use any desired schema language or languages for its schema output. The TEI ODD specification uses RELAX NG to express content models, and is therefore biased towards this language. However, the current TEI ODD processing system is capable of producing schema output in the three main schema languages, as follows:

- A RELAX NG (XML) schema is generated by creating wrappers around the content models taken directly from the ODD specification; a version re-expressed in the RELAX NG compact syntax is generated using James Clark's *trang* application.
- A DTD schema is generated by converting the RELAX NG content models to DTD language, often simplifying it to allow for the less-sophisticated output language.
- A W3C Schema schema is created by generating a RELAX NG schema and then using James Clark's *trang* application.

Note that the method used to generate W3C Schema means that a processor must ensure that the RELAX NG it generates follows the subset which *trang* is able to translate properly (see further below)—this may involve simple trial and error.

Other projects may decide to follow a different route, perhaps implementing a direct ODD to W3C Schema translator.

Secondly, it is possible to create two rather different styles of schema. On the one hand, the schema can try to maintain all the flexibility of ODD by using the facilities of the schema language for parameterization; on the other, it can remove all customization features and produce a flat result which is not suitable for further manipulation. The TEI project currently generates both styles of schema; the first as a set of schema fragments in DTD and RELAX NG languages,

¹²⁹Note that deletion of required elements will cause the schema specification to accept as valid documents which cannot be TEI Conformant, since they no longer conform to the TEI Abstract Model; conformance topics are addressed in more detail in 23.4. *Conformance*.

which can be included as modules in other schemas, and customized further; the second as the output from a processor such as Roma, in which many of the parameterization features have been removed.

The difference between the schema styles may be illustrated by considering this ODD specification:

```
<elementSpec module="drama" ident="performance">
<!-- ... -->
<classes>
  <memberOf key="model.frontPart.drama"/>
</classes>
<content>
  <rng:group>
    <rng:zeroOrMore>
      <rng:choice>
        <rng:ref name="model.divTop"/>
        <rng:ref name="model.global"/>
      </rng:choice>
    </rng:zeroOrMore>
    <rng:oneOrMore>
      <rng:group>
        <rng:ref name="model.common"/>
      </rng:group>
      <rng:zeroOrMore>
        <rng:ref name="model.global"/>
      </rng:zeroOrMore>
    </rng:oneOrMore>
    <rng:zeroOrMore>
      <rng:ref name="model.divBottom"/>
      <rng:zeroOrMore>
        <rng:ref name="model.global"/>
      </rng:zeroOrMore>
    </rng:zeroOrMore>
  </rng:group>
</content>
<!-- ... -->
</elementSpec>
```

A simple rendering to RELAX NG produces this:

```
performance =
element performance {
(model.divTop | model.global)*,
(model.common, model.global)*,
(model.divBottom, model.global)*
att.global.attribute.xmlspace,
att.global.attribute.xmlid,
att.global.attribute.n,
att.global.attribute.xmllang,
att.global.attribute.rend,
att.global.attribute.xmlbase,
att.global.linking.attribute.corresp,
att.global.linking.attribute.synch,
att.global.linking.attribute.sameAs,
att.global.linking.attribute.copyOf,
att.global.linking.attribute.next,
att.global.linking.attribute.prev,
att.global.linking.attribute.exclude,
```

```
att.global.linking.attribute.select
}
```

In the above, a subsequent redefinition of the attribute class (such as `att.global`) would have no effect, since references to such classes have been expanded to reference their constituent attributes.

The equivalent parameterized version might look like this:

```
performance =
element performance { performance.content, performance.attributes }
performance.content =
(model.divTop | model.global)*,
(model.common, model.global*)+,
(model.divBottom, model.global*)*
performance.attributes = att.global.attributes, empty
```

Here, the attribute class `att.global` is provided via an explicit reference (`att.global.attributes`), and can therefore be redefined. Moreover, the attributes are separated from the content model, allowing either to be overridden.

In the remainder of these section, the terms *simple schema* and *parameterized schema* are used to distinguish the two schema types. An ODD processor is not required to support both, though the simple schema output is generally preferable for most applications.

Thirdly, the problem of missing components must be resolved. For example, consider this (fictitious) model for `<sp>`:

```
<elementSpec ident="sp">
<!--...-->
<content>
  <rng:zeroOrMore>
    <rng:ref name="model.global"/>
  </rng:zeroOrMore>
  <rng:optional>
    <rng:ref name="speaker"/>
    <rng:zeroOrMore>
      <rng:ref name="model.global"/>
    </rng:zeroOrMore>
  </rng:optional>
</content>
<!--...-->
</elementSpec>
```

This proposes anything from the global model class, followed by some `<speaker>` elements, followed by anything from the `model.global` class. What happens if `<speaker>` is removed? The following would result:

```
<elementSpec ident="sp">
<!--...-->
<content>
  <rng:zeroOrMore>
    <rng:ref name="model.global"/>
  </rng:zeroOrMore>
  <rng:zeroOrMore>
    <rng:ref name="model.global"/>
  </rng:zeroOrMore>
</content>
<!--...-->
</elementSpec>
```

which is illegal in DTD and W3C schema languages, since for a given member of `model.global` it is impossible to be sure which rule is being used. This situation is not detected when RELAX NG is used, since the language is able to cope with non-deterministic content models of this kind and does not require that only a single rule be used.

Finally, an application will need to have some method of associating the schema with document instances that use it. The TEI does not mandate any particular method of doing this, since different schema languages and processors vary considerably in their requirements. ODD processors may wish to build in support for some of the methods for associating a document instance with a schema. The TEI does not mandate any particular method, but does suggest that those which are already part of XML (the DOCTYPE declaration for DTDs) and W3C Schema (the `xsi:schemaLocation` attribute) be supported where possible.

In order for the `xsi:schemaLocation` attribute to be valid when a document is validated against either a DTD or a RELAX NG schema, ODD processors may wish to add declarations for this attribute and its namespace to the root element, even though these are not part of the TEI *per se*. For DTDs this means adding

```
xsi:schemaLocation CDATA #IMPLIED xmlns:xsi CDATA #FIXED 'http://www.w3.org/2001/XMLSchema-instance'
```

to the list of attributes on the root element, which permits the non-namespace-aware DTD language to recognize the `xsi:schemaLocation` notation. For RELAX NG, the namespace and attribute would be declared in the usual way:

```
namespace xsi = "http://www.w3.org/2001/XMLSchema-instance"
```

and

```
attribute xsi:schemaLocation { list { data.namespace, data.pointer }+ }
```

inside the root element declaration.

Note that declaration of the `xsi:schemaLocation` attribute in a W3C Schema schema is not permitted. Therefore, if W3C Schemas are being generated by converting the RELAX NG schema (for example, with `trang`), it may be necessary to perform that conversion prior to adding the `xsi:schemaLocation` declaration to the RELAX NG.

It is recognized that this is an unsatisfactory solution, but it permits users to take advantage of the W3C Schema facility for indicating a schema, while still permitting documents to be validated using DTD and RELAX NG processors without any conflict.

23.5.3 Names and Documentation in Generated Schemas

When processing class, element, or macro specifications, there are three general rules:

1. If a RELAX NG pattern or DTD parameter entity is being created, its name is the value of the corresponding `ident` attribute, prefixed by the value of any prefix attribute on `<schemaSpec>`. This allows for elements from an external schema to be mixed in without risk of name clashes, since all TEI elements can be given a distinctive prefix such as `tei_`. Thus

```
<schemaSpec ident="test" prefix="tei_">
  <elementSpec ident="sp">
<!-- ... -->
  </elementSpec>
</schemaSpec>
```

may generate a RELAX NG (compact syntax) pattern like this:

```
tei_sp = element sp { ... }
```

References to these patterns (or, in DTDs, parameter entities) also need to be prefixed with the same value.

2. If an element or attribute is being created, its default name is the value of the `ident` attribute, but if there is an `<altIdent>` child, its content is used instead.
3. Where appropriate, the documentation strings in `<gloss>` and `<desc>` should be copied into the generated schema. If there is only one occurrence of either of these elements, it should be used regardless, but if there are several, local processing rules will need to be applied. For example, if there are several with different values of `xml:lang`, a locale indication in the processing environment might be used to decide which to use. For example,

```
<elementSpec module="core" ident="head">
  <equiv/>
  <gloss>heading</gloss>
  <gloss xml:lang="fr">en-tête</gloss>
  <gloss xml:lang="es">encabezamiento</gloss>
  <gloss xml:lang="it">titolo</gloss>
  <!-- ... -->
</elementSpec>
```

might generate a RELAX NG schema fragment like the following, if the locale is determined to be French:

```
head =
## en-tête
element head { head.content, head.attributes }
```

Alternatively, a selection might be made on the basis of the value of the version attribute which these elements carry as members of the `att.translatable` class.

In addition, there are three conventions about naming patterns relating to classes; ODD processors need not follow them, but those reading the schemas generated by the TEI project will find it necessary to understand them:

1. when a pattern for an attribute class is created, it is named after the attribute class identifier (as above) suffixed by `.attributes` (e.g. `att.editLike.attributes`);
2. when a pattern for an attribute is created, it is named after the attribute class identifier (as above) suffixed by `.attribute`. and then the identifier of the attribute (e.g. `att.editLike.attribute.resp`);
3. when a parameterized schema is created, each element generates patterns for its attributes and its contents separately, suffixing respectively `.attributes` and `.contents` to the element name.

23.5.4 Making a RELAX NG Schema

To create a RELAX NG schema, the processor processes every `<macroSpec>`, `<classSpec>`, and `<elementSpec>` in turn, creating a RELAX NG pattern for each, using the naming conventions listed above. The order of declaration is not important, and a processor may well sort them into alphabetical order of identifier.

A complete RELAX NG schema must have an `<rng:start>` element defining which elements can occur as the root of a document. The ODD `<schemaSpec>` has an optional `start` attribute, containing one or more element names, which can be used to construct the `<rng:start>`.

23.5.4.1 Macros

An ODD macro generates a corresponding RELAX NG pattern simply by copying the body of the `<content>` element. Thus

```
<macroSpec module="tei" type="pe" ident="macro.phraseSeq">
  <content>
    <rng:zeroOrMore>
      <rng:choice>
        <rng:text/>
```

```
<rng:ref name="model.gLike"/>
<rng:ref name="model.phrase"/>
<rng:ref name="model.global"/>
</rng:choice>
</rng:zeroOrMore>
</content>
</macroSpec>
```

produces

```
<rng:define name="macro.phraseSeq">
  <rng:zeroOrMore>
    <rng:choice>
      <rng:text/>
      <rng:ref name="model.gLike"/>
      <rng:ref name="model.phrase"/>
      <rng:ref name="model.global"/>
    </rng:choice>
  </rng:zeroOrMore>
</rng:define>
```

Although some versions of these Guidelines show the RELAX NG output in the compact syntax, both the content of the `<content>` element and the unified ODD specification generated by the TEI ODD processing software always store RELAX NG in the more verbose XML syntax. However, the two formats are interchangeable.

23.5.4.2 Classes

An ODD model class reference generates a RELAX NG pattern definition listing all the members of the class present in the ODD in alternation. So this example

```
<classSpec module="tei" type="model" ident="model.measureLike">
<!-- ... -->
</classSpec>
```

may produce, for a given customization:

```
<rng:define name="model.measureLike">
  <rng:choice>
    <rng:ref name="num"/>
    <rng:ref name="measure"/>
    <rng:ref name="measureGrp"/>
  </rng:choice>
</rng:define>
```

if the elements `<num>`, `<measure>`, and `<measureGrp>` are included. Depending on the value of the `generate` attribute on the `<classSpec>`, it may also generate a set of sequences as well as alternation patterns. Thus we may also generate the sequence, `sequenceOptional`, `sequenceRepeatable`, and `sequenceOptionalRepeatable` patterns:

```
<rng:define name="model.measureLike_sequence">
  <rng:ref name="num"/>
  <rng:ref name="measure"/>
  <rng:ref name="measureGrp"/>
</rng:define>
```

```

<rng:define name="model.measureLike_sequenceOptional">
  <rng:optional>
    <rng:ref name="num"/>
  </rng:optional>
  <rng:optional>
    <rng:ref name="measure"/>
  </rng:optional>
  <rng:optional>
    <rng:ref name="measureGrp"/>
  </rng:optional>
</rng:define>
<rng:define
  name="model.measureLike_sequenceOptionalRepeatable">
  <rng:zeroOrMore>
    <rng:ref name="num"/>
  </rng:zeroOrMore>
  <rng:zeroOrMore>
    <rng:ref name="measure"/>
  </rng:zeroOrMore>
  <rng:zeroOrMore>
    <rng:ref name="measureGrp"/>
  </rng:zeroOrMore>
</rng:define>
<rng:define name="model.measureLike_sequenceRepeatable">
  <rng:oneOrMore>
    <rng:ref name="num"/>
  </rng:oneOrMore>
  <rng:oneOrMore>
    <rng:ref name="measure"/>
  </rng:oneOrMore>
  <rng:oneOrMore>
    <rng:ref name="measureGrp"/>
  </rng:oneOrMore>
</rng:define>

```

where the pattern name is created by appending an underscore and the name of the generation sequence to the class name.

Attribute classes work by producing a pattern containing definitions of the appropriate attributes. So

```

<classSpec module="verse" type="atts" ident="att.enjamb">
  <attList>
    <attDef ident="enjamb" usage="opt">
      <equiv/>
      <desc>indicates whether the end of a verse line is marked by enjambement.</desc>
      <datatype>
        <rng:ref name="data.enumerated"/>
      </datatype>
      <valList type="open">
        <valItem ident="no">
          <equiv/>
          <desc>the line is end-stopped
          </desc>
        </valItem>
        <valItem ident="yes">
          <equiv/>
          <desc>the line in question runs on into the next

```

```
        </desc>
      </valItem>
      <valItem ident="weak">
        <equiv/>
        <desc>the line is weakly enjambed
      </desc>
      </valItem>
      <valItem ident="strong">
        <equiv/>
        <desc>the line is strongly enjambed</desc>
      </valItem>
    </valList>
  </attDef>
</attList>
</classSpec>
```

produces

```
<rng:define name="att.enjamb.attributes">
  <rng:ref name="att.enjamb.attribute.enjamb"/>
  <rng:empty/>
</rng:define>
<rng:define name="att.enjamb.attribute.enjamb">
  <rng:optional>
    <rng:attribute name="enjamb">
      <a:documentation>(enjambement)
        indicates whether the end of a verse line is marked by enjambement.
        Sample values include: 1] no; 2] yes; 3] weak; 4] strong</a:documentation>
      <rng:ref name="data.enumerated"/>
    </rng:attribute>
  </rng:optional>
</rng:define>
```

Since the processor may have expanded the attribute classes already, separate patterns are generated for each attribute in the class as well as one for the class itself. This allows an element to refer directly to a member of a class. Notice that the <desc> element is used to add an <a:documentation> element to the schema, which some editors use to provide help during composition. The <desc> elements in the <valList> are used to create the human-readable sentence ‘Sample values include: 1] no; 2] yes; 3] weak; 4] strong’ Naturally, this behaviour is not mandatory; and other ODD processors may create documentation in other ways, or ignore those parts of the ODD specifications when creating schemas.

An individual attribute consists of an <rng:attribute> with a name attribute derived according to the naming rules described above (23.5.3. *Names and Documentation in Generated Schemas*). In addition, the ODD model supports a <defaultVal>, which is transformed to a defaultValue attribute in the namespace <http://relaxng.org/ns/compatibility/annotations/1.0> attribute on the <rng:attribute>. The body of the attribute is taken from the <datatype> child, unless there is a supporting <valList> with a type value of closed. In that case an <rng:choice> is created, listing the allowed values. Thus the following attribute definition

```
<attDef ident="full" usage="opt">
  <defaultVal>yes</defaultVal>
  <valList type="closed">
    <valItem ident="yes">
      <desc>the name component is spelled out in full.</desc>
    </valItem>
    <valItem ident="abb">
      <gloss>abbreviated</gloss>
    </valItem>
  </valList>
</attDef>
```

```

    <desc>the name component is given in an abbreviated form.</desc>
  </valItem>
  <valItem ident="init">
    <gloss>initial letter</gloss>
    <desc>the name component is indicated only by one initial.</desc>
  </valItem>
</valList>
</attDef>

```

may generate this RELAX NG code:

```

<rng:define name="att.full">
  <rng:optional>
    <rng:attribute name="full" a:defaultValue="yes">
      <rng:choice>
        <rng:value>yes</rng:value>
        <a:documentation>the name component is spelled out in full.
        </a:documentation>
        <rng:value>abb</rng:value>
        <a:documentation>the name component is given in an abbreviated form.
        </a:documentation>
        <rng:value>init</rng:value>
        <a:documentation>the name component is indicated only by one initial.
        </a:documentation>
      </rng:choice>
    </rng:attribute>
  </rng:optional>
</rng:define>

```

Note the use of the <http://relaxng.org/ns/compatibility/annotations/1.0> namespace to provide default values and documentation.

23.5.4.3 Elements

An `<elementSpec>` produces a RELAX NG specification in two parts; firstly, it must generate an `<rng:define>` pattern by which other elements can refer to it, and then it must generate an `<rng:element>` with the content model and attributes. It may be convenient to make two separate patterns, one for the element's attributes and one for its content model.

The content model is created simply by copying the body of the `<content>` element; the attributes are processed in the same way as those from attribute classes, described above.

23.5.5 Making a DTD

Generation of DTDs largely follows the same pattern as RELAX NG generation, with one important exception—*the order of declaration matters*. A DTD may not refer to an entity which has not yet been declared. Since both macros and classes generate DTD parameter entities, the TEI Guidelines are constructed so that they can be declared in the right order. A processor must therefore work in the following order:

1. declare all model classes which have a predeclare value of true
2. declare all macros which have a predeclare value of true
3. declare all other classes
4. declare the modules (if DTD fragments are being constructed)
5. declare any remaining macros
6. declare the elements and their attributes

Let us consider a complete example, a simple element with no attributes of its own:

```
<elementSpec module="namesdates" ident="faith">
  <desc>specifies the faith, religion, or belief set of a person.</desc>
  <classes>
    <memberOf key="model.persStateLike"/>
    <memberOf key="att.editLike"/>
    <memberOf key="att.dataable"/>
  </classes>
  <content>
    <rng:ref name="macro.phraseSeq"/>
  </content>
</elementSpec>
```

If DTD fragments are being generated (for use as described in 23.5.7. *Using TEI Parameterized Schema Fragments*), this will result in the following:

```
<!ENTITY % faith 'INCLUDE' >
<![ %faith; [
  <!--doc:specifies the faith, religion, or belief set of a person. -->
  <!ELEMENT %n.faith; %om.RR; %macro.phraseSeq;>
  <!ATTLIST %n.faith; xmlns CDATA "http://www.tei-c.org/ns/1.0">
  <!ATTLIST %n.faith;
    %att.global.attributes;
    %att.editLike.attributes;
    %att.dataable.attributes; >
  ]]>
```

Here the whole stanza is contained in a marked section (for use as described in 23.5.7.2. *Inclusion and Exclusion of Elements*), the element name is parameterized (see 23.5.7.3. *Changing the Names of Generic Identifiers*), and the class attributes are entity references derived from the <memberOf> records in <classes>. Note the additional attribute which provides a default xmlns declaration for the element; the effect of this is that if the document is processed by a DTD-aware XML processor, the namespace declaration will be present automatically without the document author even being aware of it.

A simpler rendition for a flattened DTD generated from a customization will result in the following, with no containing marked section, and no parameterized name:

```
<!ELEMENT faith %macro.phraseSeq;>
<!ATTLIST faith xmlns CDATA "http://www.tei-c.org/ns/1.0">
<!ATTLIST faith
  %att.global.attribute.xmlspace;
  %att.global.attribute.xmlid;
  %att.global.attribute.n;
  %att.global.attribute.xmllang;
  %att.global.attribute.rend;
  %att.global.attribute.xmlbase;
  %att.global.linking.attribute.corresp;
  %att.global.linking.attribute.synch;
  %att.global.linking.attribute.sameAs;
  %att.global.linking.attribute.copyOf;
  %att.global.linking.attribute.next;
  %att.global.linking.attribute.prev;
  %att.global.linking.attribute.exclude;
  %att.global.linking.attribute.select;
  %att.editLike.attribute.cert;
  %att.editLike.attribute.resp;
```

```
%att.editLike.attribute.evidence;
%att.dateable.w3c.attribute.period;
%att.dateable.w3c.attribute.when;
%att.dateable.w3c.attribute.notBefore;
%att.dateable.w3c.attribute.notAfter;
%att.dateable.w3c.attribute.from;
%att.dateable.w3c.attribute.to;>
```

Here the attributes from classes have been expanded into individual entity references.

23.5.6 Generating Documentation

In Donald Knuth's literate programming terminology (Knuth (1992)), the previous sections have dealt with the *tangle* process; to generate documentation, we now turn to the *weave* process.

An ODD customization may consist largely of general documentation and examples, requiring no ODD-specific processing. It will normally however also contain a `<schemaSpec>` element and possibly some `<specGrp>` fragments.

The generated documentation may be of two forms. On the one hand, we may document the customization itself, that is, only those elements (etc.) which differ in their specification from that provided by the TEI reference documentation. Alternatively, we may generate reference documentation for the complete subset of the TEI which results from applying the customization. The TEI Roma tools take the latter approach, and operate on the result of the first stage processing described in 23.5.1. *Making a Unified ODD*.

Generating reference documentation for `<elementSpec>`, `<classSpec>`, and `<macroSpec>` elements is largely dependent on the design of the preferred output. Some applications may, for example, want to turn all names of objects into hyperlinks, show lists of class members, or present lists of attributes as tables, lists, or inline prose. Another technique implemented in these Guidelines is to show lists of potential 'parents' for each element, by tracing which other elements have them as possible members of their content models.

One model of display on a web page is shown in 23, corresponding to the `<faith>` element shown in section 23.5.5. *Making a DTD*.

<faith>		Home Table of Contents Element catalogue
<faith> specifies the faith, religion, or belief set of a person.		
Module	namesdates — 13 Names, Dates, People, and Places	
Attributes	[att.editLike att.dateable]	
Declaration	<div> <pre> element faith { att.global.attributes, att.editLike.attributes, att.dateable.w3c.attributes, att.dateable.iso.attributes, macro.phraseSeq } </pre> </div> <div>Compact to XML format</div>	
Example	<faith>protestant</faith>	
Contained by	model.persTraitLike	

Figure 23: Example reference documentation for <faith>

23.5.7 Using TEI Parameterized Schema Fragments

The TEI parameterized DTD and RELAX NG fragments make use of parameter entities and patterns for several purposes. In this section we describe their interface for the user. In general we recommend use of ODD instead of this technique.

23.5.7.1 Selection of Modules

Special-purpose parameter entities are used to specify which modules are to be combined into a TEI DTD. They take the form `TEI.xxxxx` where `xxxx` is the name of the module as given in table the table on p. 2 in *1.1. TEI Modules*. For example, the parameter entity `TEI.linking` is used to define whether or not to include the module `linking`. All such parameter entities are declared by default with the value `IGNORE`: to select a module, therefore, the encoder declares the appropriate parameter entities with the value `INCLUDE`.

For XML DTD fragments, note that some modules generate two DTD fragments: for example the `analysis` module generates fragments called `analysis-decl` and `analysis`. This is because the declarations they contain are needed at different points in the creation of an XML DTD.

The parameter entity named for the module is used as the keyword controlling a conditional marked section in the DTD fragment generated by the `tei` module. The declarations for each DTD fragment constituting the module are contained within such marked sections. For example, the parameter entity `TEI.linking` appears twice in `tei.dtd`, once for the `linking-decl` schema fragment:

```
<!ENTITY % TEI.linking 'IGNORE' >
<![%TEI.linking;[
<!ENTITY % file.linking-decl PUBLIC '-//TEI P5//ENTITIES Linking, Segmentation, and Alignment//EN' 'linking-
decl.dtd' >
%file.linking-decl;
]] >
```

and once for the `linking` schema fragment:

```
<![%TEI.linking;[
<!ENTITY % file.linking PUBLIC '-//TEI P5//ELEMENTS Linking, Segmentation, and Alignment//EN' 'linking.dtd'
>
%file.linking;
]] >
```

If `TEI.linking` has its default value of `IGNORE`, neither declaration has any effect. If however it has the value `INCLUDE`, then the content of each marked section is acted upon: the parameter entities `file.linking` and `file.linking-decl` are referenced, which has the effect of embedding the content of the files they represent at the appropriate point in the DTD.

The RELAX NG schema fragments can be combined in a wrapper schema using the standard mechanism of `<rng:include>` in that language.

23.5.7.2 Inclusion and Exclusion of Elements

The TEI DTD fragments also use marked sections and parameter entity references to allow users to exclude the definitions of individual elements, in order either to make the elements illegal in a document or to allow the element to be redefined. The parameter entities used for this purpose have exactly the same name as the generic identifier of the element concerned. The default definition for these parameter entities is `INCLUDE` but they may be changed to `IGNORE` in order to exclude the standard element and attribute definition list declarations from the DTD.

The declarations for the element `<p>`, for example, are preceded by a definition for a parameter entity with the name `p` and contained within a marked section whose keyword is given as `%p`:

```
<!ENTITY % p 'INCLUDE' >
<![ %p; [
<!-- element and attribute list declaration for p here -->
]]
```

These parameter entities are defined immediately preceding the element whose declarations they control; because their names are completely regular, they are not documented further.

To define a DTD in which the element `<p>` is excluded therefore, the entity `p` needs to be redefined as `IGNORE` by ensuring that a declaration such as

```
<!ENTITY % p 'IGNORE' >
```

is added earlier in the DTD than the default (see further 23.5.7.4. *Embedding Local Modifications (DTD only)*).

Similarly, in the parameterized RELAX NG schemas, every element is defined by a pattern named after the element. To undefine an element therefore all that is necessary is to add a declaration like the following:

```
p = notAllowed
```

23.5.7.3 Changing the Names of Generic Identifiers

In the TEI DTD fragments, elements are not referred to directly by their generic identifiers; instead, the DTD fragments refer to parameter entities which expand to the standard generic identifiers. This allows users to rename elements by redefining the appropriate parameter entity. Parameter entities used for this purpose are formed by taking the standard generic identifier of the element and attaching the string `n.` as a prefix. Thus the standard generic identifiers for paragraphs, notes, and quotations, `<p>`, `<note>`, and `<persName>` are defined by declarations of the following form:

```
<!ENTITY % n.p "p">
<!ENTITY % n.note "note">
<!ENTITY % n.persName "persName">
```

Note that since all names are case-sensitive, the specific mix of uppercase and lowercase letters in the standard generic identifier must be preserved in the entity name.

These declarations are generated by an ODD processor when TEI DTD fragments are created.

In the RELAX NG schemas, all elements are normally defined using a pattern with the same name as the element (as described in 23.5.3. *Names and Documentation in Generated Schemas*): for example

```
abbr = element abbr { abbr.content, abbr.attributes }
```

The easiest way of renaming the element is thus simply to rewrite the pattern with a different element name; any references use the pattern, not the element, name.

```
abbr = element abbrev { abbr.content, abbr.attributes }
```

More complex revisions, such as redefining the content of the element (defined by the pattern `abbr.content`) or its attributes (defined by the pattern `abbr.attributes`) can be accomplished in a similar way, using the features of the RELAX NG language. The recommended method of carrying out such modifications is however to use the ODD language as further described in section 22. *Documentation Elements*.

23.5.7.4 Embedding Local Modifications (DTD only)

Any local modifications to a DTD (i.e. changes to a schema other than simple inclusion or exclusion of modules) are made by declarations stored in one of two local extension files, one containing modifications to the TEI parameter entities, and the other new or changed declarations of elements and their attributes. Entity declarations must be made which associate the names of these two files with the appropriate parameter entity so that the declarations they contain can be embedded within the TEI DTD at an appropriate point.

The following entities are referred to by the main `tei.dtd` file to embed portions of the TEI DTD fragments or locally developed extensions.

TEI.extensions.ent identifies a local file containing extensions to the TEI parameter entities

TEI.extensions.dtd identifies a local file containing extensions to the TEI module

For example, if the relevant files are called `project.ent` and `project.dtd`, then declarations like the following would be appropriate:

```
<!ENTITY % TEI.extensions.ent SYSTEM 'project.ent' >
<!ENTITY % TEI.extensions.dtd SYSTEM 'project.dtd' >
```

When an entity is declared more than once, the first declaration is binding and the others are ignored. The local modifications to parameter entities should therefore be handled before the standard parameter entities themselves are declared in `tei.dtd`. The entity `TEI.extensions.ent` is referred to before any TEI declarations are handled, to allow the user's declarations to take priority. If the user does not provide a `TEI.extensions.ent` entity, the entity will be expanded to the empty string.

For example the encoder might wish to add two phrase-level elements `<it>` and `<bd>`, perhaps as synonyms for `<hi rend='italics'>` and `<hi rend='bold'>`. As described in chapter 23.3. *Personalization and Customization*, this involves two distinct steps: one to define the new elements, and the other to ensure that they are placed into the TEI document structure at the right place.

Creating the new declarations is done in the same way for user-defined elements as for any other; the same parameter entities need to be defined so that they may be referenced by other elements. The content models of these new elements may also reference other parameter entities, which is why they need to be declared after other declarations.

The second step involves modifying the element class to which the new elements should be attached. This requires that the parameter entity `macro.phraseSeq` should be modified to include the generic identifiers for the new elements we wish to create. The declaration for each modifiable parameter entity in the DTD includes a reference to an additional parameter entity with the same name prefixed by an `x.`; these entities are declared by default as the null string. However, in the file containing local declarations they may be redeclared to include references to the new class members:

```
<!ENTITY % x.macro.phraseSeq 'it | bd |'>
```

and this declaration will take precedence over the default when the declaration for `macro.phraseSeq` is evaluated.

A Model Classes

model.addressLike groups elements used to represent a postal or e-mail address. [1. *The TEI Infrastructure*]

Module tei — The TEI Infrastructure

Used by location model.pPart.data

Members address affiliation email

model.addrPart groups elements such as names or postal codes which may appear as part of a postal address. [3.5.2. *Addresses*]

Module tei — The TEI Infrastructure

Used by address

B Attribute Classes

att.ascribed provides attributes for elements representing speech or action that can be ascribed to a specific individual. [1. The TEI Infrastructure]

Module tei — The TEI Infrastructure

Members change incident kinesic move pause q said setting shift sp spGrp stage u vocal writing

Attributes Attributes

@who indicates the person, or group of people, to whom the element content is ascribed.

Status Optional

Datatype 1–∞ occurrences of `data.pointer` separated by whitespace

Values For transcribed speech, this will typically identify a participant or participant group; in other contexts, it will point to any identified <person> element.

In the following example from Hamlet, speeches (<sp>) in the body of the play are linked to <castItem> elements in the <castList> using the who attribute. <castItem

```
type="role">
<role
  xml:id="Barnardo">Barnardo</role>
</castItem>
<castItem
  type="role">
<role
  xml:id="Francisco">Francisco</role>
<roleDesc>a soldier</roleDesc>
</castItem>
<!-- ... -->
<sp
  who="#Barnardo">
<speaker>Barnardo</speaker>
<l
  n="1">Who's there?</l>
</sp>
<sp
  who="#Francisco">
<speaker>Francisco</speaker>
<l
  n="2">Nay, answer me: stand, and unfold yourself.</l>
</sp>
```

att.breaking provides an attribute to indicate whether or not the element concerned is considered to mark the end of an orthographic token in the same way as whitespace. [3.10.3. Milestone Elements]

Module tei — The TEI Infrastructure

Members cb gb lb milestone pb

Attributes Attributes

@break indicates whether or not the element bearing this attribute should be considered to mark the end of an orthographic token in the same way as whitespace.

Status Recommended

Datatype `data.enumerated`

Sample values include yes the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace

no the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace

maybe l'encodage ne prends aucune position sur la question.

In the following lines from the ‘Dream of the Rood’, linebreaks occur in the middle of the words *lāðost* and *reord-berendum*. **<ab>** ...epesa tome iu icpæs 3eporden pita heardoft . leodum la**<lb**

break="no"/>

ðost ærþan ichim lifes pe3 rihtne 3erymde reord be**<lb**

break="no"/>

rendum hƿæt me þa3eƿeorðode puldres ealdor ofer...

</ab>

att.canonical provides attributes which can be used to associate a representation such as a name or title with canonical information about the object being named or referenced.

Module tei — The TEI Infrastructure

Members att.naming[att.personal[addName forename genName name orgName persName placeName roleName surname] affiliation author birth bloc climate collection country death district editor education event geogFeat geogName institution nationality occupation origPlace population pubPlace region repository residence rs settlement socecStatus state terrain trait] docAuthor docTitle faith material objectType relation resp term title

Attributes Attributes

@key provides an externally-defined means of identifying the entity (or entities) being named, using a coded value of some kind.

Status Optional

Datatype data.text

<author>

<name

key="name 427308"

type="organisation">[New Zealand Parliament, Legislative Council]</name>

</author>

<author>

<name

key="Hugo, Victor (1802-1885)"

ref="http://www.idref.fr/026927608">Victor Hugo</name>

</author>

Note The value may be a unique identifier from a database, or any other externally-defined string identifying the referent. No particular syntax is proposed for the values of the key attribute, since its form will depend entirely on practice within a given project. For the same reason, this attribute is not recommended in data interchange, since there is no way of ensuring that the values used by one project are distinct from those used by another. In such a situation, a preferable approach for magic tokens which follows standard practice on the Web is to use a ref attribute whose value is a tag URI as defined in RFC 4151.

@ref (reference) provides an explicit means of locating a full definition for the entity being named by means of one or more URIs.

Status Optional

Datatype 1–∞ occurrences of data.pointer separated by whitespace

Note The value must point directly to one or more XML elements by means of one or more URIs, separated by whitespace. If more than one is supplied, the implication is that the name identifies several distinct entities.

att.combinable provides attributes indicating how multiple references to the same object in a schema should be combined

Module tagdocs — Documentation Elements

Members att.identified[attDef classSpec constraintSpec elementSpec macroSpec moduleSpec schemaSpec] valDesc valItem valList

Attributes att.deprecated (@validUntil)

@mode specifies the effect of this declaration on its parent object.

Status Optional

Datatype data.enumerated

Legal values are: **add** this declaration is added to the current definitions[Default]

delete if present already, the whole of the declaration for this object is removed from the current setup

change this declaration changes the declaration of the same name in the current definition

replace this declaration replaces the declaration of the same name in the current definition

Note An ODD processor should handle the values for mode as follows:

add the object should be created (processing any children in add mode); raise an error if an object with the same identifier already exists

replace use this object in preference to any existing object with the same identifier, and ignore any children of that object; process any new children in replace mode

delete do not process this object or any existing object with the same identifier; raise an error if any new children supplied

change process this object, and process its children, and those of any existing object with the same identifier, in change mode

att.coordinated elements which can be positioned within a two dimensional coordinate system.

Module transcr — Representation of Primary Sources

Members line surface surfaceGrp zone

Attributes Attributes

@start indicates the element within a transcription of the text containing at least the start of the writing represented by this zone or surface.

Status Optional

Datatype data.pointer

@ulx gives the x coordinate value for the upper left corner of a rectangular space.

Status Optional

Datatype data.numeric

@uly gives the y coordinate value for the upper left corner of a rectangular space.

Status Optional

Datatype data.numeric

@lrx gives the x coordinate value for the lower right corner of a rectangular space.

Status Optional

Datatype data.numeric

@lry gives the y coordinate value for the lower right corner of a rectangular space.

Status Optional

Datatype data.numeric

att.cReferencing provides an attribute which may be used to supply a *canonical reference* as a means of identifying the target of a pointer.

Module tei — The TEI Infrastructure

Members gloss ptr ref term

Attributes Attributes

@cRef (canonical reference) specifies the destination of the pointer by supplying a canonical reference from a scheme defined in a <refsDecl> element in the TEI header

Status Optional

Datatype data.text

Values the value of cRef should be constructed so that when the algorithm for the resolution of canonical references (described in section 16.2.6. *Canonical References*) is applied to it the result is a valid URI reference to the intended target

Note The <refsDecl> to use may be indicated with the decls attribute. Currently these Guidelines only provide for a single canonical reference to be encoded on any given <ptr> element.

att.damaged provides attributes describing the nature of any physical damage affecting a reading. [1.3.1. *Attribute Classes*]

Module tei — The TEI Infrastructure

Members damage damageSpan

Attributes att.dimensions (@unit, @quantity, @extent, @precision, @scope) (att.ranging (@atLeast, @atMost, @min, @max, @confidence))

@hand in the case of damage (deliberate defacement, inking out, etc.) assignable to a distinct hand, signifies the hand responsible for the damage.

Status Optional

Datatype data.pointer

Values must be one of the hand identifiers declared in the document header (see section 11.3.2.1. *Document Hands*).

@agent categorizes the cause of the damage, if it can be identified.

Status Optional

Datatype data.enumerated

Sample values include: **rubbing** damage results from rubbing of the leaf edges

mildew damage results from mildew on the leaf surface

smoke damage results from smoke

@degree signifies the degree of damage according to a convenient scale. The <damage> tag with the degree attribute should only be used where the text may be read with some confidence; text supplied from other sources should be tagged as <supplied>.

Status Optional

Datatype

data.probability | data.certainty

Values a coded representation of the degree of damage, either as a number between 0 (undamaged) and 1 (very extensively damaged), or as one of the codes high, medium, low, or unknown.

Note The <damage> tag with the degree attribute should only be used where the text may be read with confidence despite the damage. It is appropriate where it is desired to record the fact of damage, though this has not affected the readability of the text (as may be the

case with weathered inscriptional materials). Where the damage has rendered the text more or less illegible either the <unclear> tag (for partial illegibility) or the <gap> tag (for complete illegibility, with no text supplied) should be used, with the information concerning the damage given in the attribute values of these tags. See section 11.3.3.2. *Use of the <gap>, , <damage>, <unclear>, and <supplied> Elements in Combination* for discussion of the use of these tags in particular circumstances.

@group assigns an arbitrary number to each stretch of damage regarded as forming part of the same physical phenomenon.

Status Optional

Datatype data.count

att.dateable provides attributes for normalization of elements that contain dates, times, or dateable events.

Module tei — The TEI Infrastructure

Members acquisition affiliation age application binding birth bloc change climate country creation custEvent date death district education event faith floruit geogFeat geogName langKnowledge langKnown licence location name nationality occupation orgName origDate origPlace origin persName population provenance region relation residence seal settlement sex socecStatus stamp state terrain time trait

Attributes att.dateable.w3c (@when, @notBefore, @notAfter, @from, @to) att.dateable.iso (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso) att.dateable.custom (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod)

@calendar indicates the system or calendar to which the date represented by the content of this element belongs.

Status Optional

Datatype data.pointer

Schematron <sch:rule context="tei:*[@calendar]"> <sch:assert test="string-length(.) gt 0">@calendar indicates the system or calendar to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert></sch:rule>

He was born on <date
calendar="#Gregorian">Feb. 22, 1732</date>
(<date
calendar="#Julian"
when="1732-02-22"> Feb. 11, 1731/32, 0.5.</date>).

@period supplies a pointer to some location defining a named period of time within which the dateable item is understood to have occurred.

Status Optional

Datatype data.pointer

Note This ‘superclass’ provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.dateable.w3c class are provided. If the module for names & dates is loaded, this class also provides attributes from the att.dateable.iso and att.dateable.custom classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

att.dateable.custom provides attributes for normalization of elements that contain dateable events to a custom dating system (i.e. other than the Gregorian used by W3 and ISO). [13.3.6. Dates and Times]

Module namesdates — Names, Dates, People, and Places

Members att.dataable[acquisition affiliation age application binding birth bloc change climate country creation custEvent date death district education event faith floruit geogFeat geogName langKnowledge langKnown licence location name nationality occupation orgName origDate origPlace origin persName placeName population provenance region relation residence seal settlement sex socecStatus stamp state terrain time trait]

Attributes Attributes

@when-custom supplies the value of a date or time in some standard form.

Status Optional

Datatype 1-∞ occurrences of `[data.word]` separated by whitespace

Values Any string representing a valid date, time, or one of a variety of combinations.

The following are examples of custom date or time formats that are *not* valid ISO or W3C format normalizations, normalized to a different dating system <p>Alhazen died in Cairo on the

<date

when="1040-03-06"

when-custom="431-06-12"> 12th day of Jumada t-Tania, 430 AH

</date>.</p>

<p>The current world will end at the

<date

when="2012-12-21"

when-custom="13.0.0.0">end of B'ak'tun 13</date>.</p>

<p>The Battle of Meggidu

(<date

when-custom="Thutmose_III:23">23rd year of reign of Thutmose III</date>).</p>

<p>Esidorus bixit in pace annos LXX plus minus sub

<date

when-custom="Ind:4-10-11">die XI mensis Octobris indictione IIII</date>

</p>Not all custom date formulations will have Gregorian equivalents.The

when-custom attribute and other custom dating are not constrained to a datatype by the TEI, but individual projects are recommended to regularize and document their dating formats.

@notBefore-custom specifies the earliest possible date for the event in some custom standard form.

Status Optional

Datatype 1-∞ occurrences of `[data.word]` separated by whitespace

Values A normalized form of temporal expression.

@notAfter-custom specifies the latest possible date for the event in some custom standard form.

Status Optional

Datatype 1-∞ occurrences of `[data.word]` separated by whitespace

Values A normalized form of temporal expression.

@from-custom indicates the starting point of the period in some standard form.

Status Optional

Datatype 1-∞ occurrences of `[data.word]` separated by whitespace

Values A normalized form of temporal expression.

<event

xml:id="FIRE1"

datingMethod="#julian"

from-custom="1666-09-02"

to-custom="1666-09-05">

<head>The Great Fire of London</head>

<p>The Great Fire of London burned through a large part of the city of London.</p>

</event>

@to-custom indicates the ending point of the period in some standard form.

Status Optional

Datatype 1-∞ occurrences of `[data.word]` separated by whitespace

Values A normalized form of temporal expression.

@datingPoint supplies a pointer to some location defining a named point in time with reference to which the datable item is understood to have occurred

Status Optional

Datatype `data.pointer`

@datingMethod supplies a pointer to a <calendar> element or other means of interpreting the values of the custom dating attributes.

Status Optional

Datatype `data.pointer`

Contayning the Originall, Antiquity, Increafe, Moderne eftate, and defcription of that Citie, written in the yeare

<date

when-custom="1598"

calendar="#julian"

datingMethod="#julian">1598</date>. by Iohn Stow

Citizen of London.

Note Here the calendar attribute points to a <calendar> element for the Julian calendar, specifying that the text content of the <date> element is a Julian date, and the datingMethod attribute also points to the Julian calendar to indicate that the content of the when-custom attribute value is Julian too.

att.datable.iso provides attributes for normalization of elements that contain datable events using the ISO 8601 standard. [13.3.6. Dates and Times]

Module namesdates — Names, Dates, People, and Places

Members att.datable[acquisition affiliation age application binding birth bloc change climate country creation custEvent date death district education event faith floruit geogFeat geogName langKnowledge langKnown licence location name nationality occupation orgName origDate origPlace origin persName placeName population provenance region relation residence seal settlement sex socecStatus stamp state terrain time trait]

Attributes Attributes

@when-iso supplies the value of a date or time in a standard form.

Status Optional

Datatype `data.temporal.iso`

Values Any string representing a valid date, time, or one of a variety of combinations.

The following are examples of ISO date, time, and date & time formats that are *not* valid W3C format normalizations. <date

when-iso="1996-09-24T07:25+00">Sept. 24th, 1996 at 3:25 in the morning</date>

<date

when-iso="1996-09-24T03:25-04">Sept. 24th, 1996 at 3:25 in the morning</date>

<time

when-iso="1999-01-04T20:42-05">4 Jan 1999 at 8:42 pm</time>

<time

when-iso="1999-W01-1T20,70-05">4 Jan 1999 at 8:42 pm</time>

<date

when-iso="2006-05-18T10:03">a few minutes after ten in the morning on Thu 18

May</date>

<time

when-iso="03:00">3 A.M.</time>

<time

when-iso="14">around two</time>

<time

when-iso="15,5">half past three</time>All of the examples of the when attribute

in the att.datable.w3c class are also valid with respect to this attribute.

He likes to be punctual. I said <q>
 <time
 when-iso="12">around noon</time>
 </q>, and he showed up at <time
 when-iso="12:00:00">12 0'clock</time> on the dot. The second occurrence of <time>
 could have been encoded with the when attribute, as 12:00:00 is a valid time with
 respect to the W3C *XML Schema Part 2: Datatypes* specification. The first occurrence
 could not.

Note The value of the when-iso attribute should be the normalized representation of the
 date, time, or combined date & time intended, in any of the standard formats
 specified by ISO 8601, using the Gregorian calendar.

@notBefore-iso specifies the earliest possible date for the event in standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype data.temporal.iso

Values A normalized form of temporal expression conforming ISO 8601.

@notAfter-iso specifies the latest possible date for the event in standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype data.temporal.iso

Values A normalized form of temporal expression conforming ISO 8601.

@from-iso indicates the starting point of the period in standard form.

Status Optional

Datatype data.temporal.iso

Values A normalized form of temporal expression conforming ISO 8601.

@to-iso indicates the ending point of the period in standard form.

Status Optional

Datatype data.temporal.iso

Values A normalized form of temporal expression conforming ISO 8601.

Note If both when-iso and dur-iso are specified, the values should be interpreted as indicating a span of time by its
 starting time (or date) and duration. That is,

```
<date when-iso="2007-06-01" dur-iso="P8D"/>
```

indicates the same time period as

```
<date when-iso="2007-06-01/P8D"/>
```

In providing a 'regularized' form, no claim is made that the form in the source text is incorrect; the
 regularized form is simply that chosen as the main form for purposes of unifying variant forms under a
 single heading.

att.dateable.w3c provides attributes for normalization of elements that contain dateable events using the W3C
 datatypes. [3.5.4. *Dates and Times* 13.3.6. *Dates and Times*]

Module tei — The TEI Infrastructure

    <date
      when="1828-03-02">March 2d. 1828.</date>
  </dateline>
  <salute>To
    Mrs. Cornell,</salute> Sunday <time
      when="12:00:00">noon.</time>
  </opener>
```

Note The value of the when attribute should be the normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by *XML Schema Part 2: Datatypes Second Edition*, using the Gregorian calendar. The most commonly-encountered format for the date part of the when attribute is yyyy-mm-dd, but yyyy, --mm, ---dd, yyyy-mm, or --mm-dd may also be used. For the time part, the form hh:mm:ss is used.
Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.

@notBefore specifies the earliest possible date for the event in standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype `data.temporal.w3c`

Values A normalized form of temporal expression conforming to the W3C *XML Schema Part 2: Datatypes Second Edition*.

@notAfter specifies the latest possible date for the event in standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype `data.temporal.w3c`

Values A normalized form of temporal expression conforming to the W3C XML Schema Part 2: Datatypes Second Edition.

@from indicates the starting point of the period in standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype `data.temporal.w3c`

Values A normalized form of temporal expression conforming to the W3C XML Schema Part 2: Datatypes Second Edition.

@to indicates the ending point of the period in standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype `data.temporal.w3c`

Values A normalized form of temporal expression conforming to the W3C XML Schema Part 2: Datatypes Second Edition.

att.datcat provides the dcr:datcat and dcr:ValueDatcat attributes which are used to align XML elements or attributes with the appropriate Data Categories (DCs) defined by the ISO 12620:2009 standard and stored in the Web repository called ISOcat at <http://www.isocat.org/>. [9.5.2. Lexical View 18.3. Other Atomic Feature Values]

Module tei — The TEI Infrastructure

Members att.lexicographic[case colloc def entryFree etym form gen gram gramGrp hom hyph iType lang lbl mood number oRef oVar orth pRef pVar per pos pron re sense subc syll tns usg xr] att.segLike[c cl m pc phr s seg w] binary f fs numeric string symbol

Attributes Attributes

@datcat contains a PID (persistent identifier) that aligns the given element with the appropriate Data Category (or categories) in ISOcat.

Status Optional

Datatype 1–∞ occurrences of `data.pointer` separated by whitespace

@valueDatcat contains a PID (persistent identifier) that aligns the content of the given element or the value of the given attribute with the appropriate simple Data Category (or categories) in ISOcat.

Status Optional

Datatype 1–∞ occurrences of `data.pointer` separated by whitespace

Example In this example dcr:datcat relates the feature name to the data category "partOfSpeech" and dcr:valueDatcat the feature value to the data category "commonNoun". Both these data categories reside in the ISOcat DCR at www.isocat.org, which is the DCR used by ISO TC37 and hosted by its registration authority, the MPI for Psycholinguistics in Nijmegen.

```
<fs
  xmlns:dcr="http://www.isocat.org/ns/dcr">
  <f
    name="POS"
    dcr:datcat="http://www.isocat.org/datcat/DC-1345"
    fVal="#commonNoun"
    dcr:valueDatcat="http://www.isocat.org/datcat/DC-1256"/>
  </fs>
```

Note ISO 12620:2009 is a standard describing the data model and procedures for a Data Category Registry (DCR). Data categories are defined as elementary descriptors in a linguistic structure. In the DCR data model each data category gets assigned a unique Persistent Identifier (PID), i.e., an URL. Linguistic resources or preferably their schemas that make use of data categories from a DCR should refer to them using this PID. For

XML-based resources, like TEI documents, ISO 12620:2009 normative Annex A gives a small Data Category Reference XML vocabulary (also available online at <http://www.isocat.org/12620/>), which provides two attributes, `dcr:datcat` and `dcr:valueDatcat`.

att.declarable provides attributes for those elements in the TEI header which may be independently selected by means of the special purpose `decls` attribute. [15.3. *Associating Contextual Information with a Text*]

Module `tei` — The TEI Infrastructure

Members `availability` `bibl` `biblFull` `biblStruct` `broadcast` `correction` `editorialDecl` `equipment` `geoDecl` `hyphenation` `interpretation` `langUsage` `listApp` `listBibl` `listEvent` `listNym` `listOrg` `listPerson` `listPlace` `metDecl` `normalization` `particDesc` `projectDesc` `quotation` `recording` `refsDecl` `samplingDecl` `scriptStmnt` `segmentation` `settingDesc` `sourceDesc` `stdVals` `styleDefDecl` `textClass` `textDesc`

Attributes `Attributes`

`@default` indicates whether or not this element is selected by default when its parent is selected.

Status `Optional`

Datatype `data.truthValue`

Legal values are: **true** This element is selected if its parent is selected

false This element can only be selected explicitly, unless it is the only one of its kind, in which case it is selected if its parent is selected. [Default]

Note The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. *Associating Contextual Information with a Text*. Only one element of a particular type may have a default attribute with a value of `true`.

att.declaring provides attributes for elements which may be independently associated with a particular declarable element within the header, thus overriding the inherited default for that element. [15.3. *Associating Contextual Information with a Text*]

Module `tei` — The TEI Infrastructure

Members `ab` `back` `body` `div` `div1` `div2` `div3` `div4` `div5` `div6` `div7` `facsimile` `floatingText` `front` `geo` `gloss` `graphic` `group` `lg` `media` `p` `ptr` `ref` `sourceDoc` `surface` `surfaceGrp` `term` `text` `u`

Attributes `Attributes`

`@decls` identifies one or more *declarable elements* within the header, which are understood to apply to the element bearing this attribute and its content.

Status `Optional`

Datatype 1–∞ occurrences of `data.pointer` separated by whitespace

Values must identify a set of declarable elements of different types.

Note The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. *Associating Contextual Information with a Text*.

att.deprecated provides attributes indicating how a deprecated feature will be treated in future releases.

Module `tagdocs` — Documentation Elements

Members `att.combinable` [`att.identified` [`attDef` `classSpec` `constraintSpec` `elementSpec` `macroSpec` `moduleSpec` `schemaSpec`] `valDesc` `valItem` `valList`]

Attributes `Attributes`

`@validUntil` provides a date before which the construct being defined will not be removed.

Status `Optional`

Datatype `xsd:date`

Schematron <sch:rule context="tei:*[@validUntil]"> <sch:assert test="@validUntil cast as xs:date ge current-date()"> <sch:value-of select="if (@ident) then concat('The ',@ident) else concat('This ',local-name(.),' of ',ancestor::tei:*[@ident][1]/@ident)"/> construct is outdated (as of <sch:value-of select="@validUntil"/>); ODD processors may ignore it, and it should probably be removed</sch:assert> <sch:report test="@validUntil cast as xs:date eq current-date()"> <sch:value-of select="if (@ident) then concat('The ',@ident) else concat('This ',local-name(.),' of ',ancestor::tei:*[@ident][1]/@ident)"/> construct will be outdated as of tomorrow; ODD processors may then ignore it, and thus it should probably be removed soon</sch:report></sch:rule>

<sch:rule context="tei:*[@validUntil]"> <sch:assert test="(@validUntil cast as xs:date - current-date()) lt (30*xs:dayTimeDuration('P1D'))"> <sch:value-of select="if (@ident) then concat('The ',@ident) else concat('This ',local-name(.),' of ',ancestor::tei:*[@ident][1]/@ident)"/> construct is outdated (as of <sch:value-of select="@validUntil"/>); ODD processors may ignore it, and it should probably be removed</sch:assert> <sch:report test="@validUntil cast as xs:date eq current-date()"> <sch:value-of select="if (@ident) then concat('The ',@ident) else concat('This ',local-name(.),' of ',ancestor::tei:*[@ident][1]/@ident)"/> construct will be outdated as of tomorrow; ODD processors may then ignore it, and thus it should probably be removed soon</sch:report></sch:rule>

Values A date (in standard yyyy-mm-dd format); at the time the attribute is added to an ODD, this date should be in the future.

Note Technically, this attribute asserts only the intent to leave a construct in future releases of the markup language being defined up to at least the specified date, and makes no assertion about what happens past that date. In practice, the expectation is that the construct will be removed from future releases of the markup language being defined sometime shortly after the validUntil date. An ODD processor will typically not process a specification element which has a validUntil date that is in the past. An ODD processor will typically warn users about constructs which have a validUntil date that is in the future. E.g., the documentation for such a construct might include the phrase *warning: deprecated* in red.

att.dimensions provides attributes for describing the size of physical objects.

Module tei — The TEI Infrastructure

Members att.damaged[*damage* *damageSpan*] att.editLike[att.transcriptional[add addSpan del delSpan mod redo restore retrace subst substJoin undo] affiliation age am birth climate corr date death education event ex expan faith floruit gap geogName langKnowledge langKnown location name nationality occupation org orgName origDate origPlace origin persName person place placeName population reg relation residence sex socecStatus state supplied surplus terrain time trait unclear] depth dim dimensions height space width

Attributes att.ranging (@atLeast, @atMost, @min, @max, @confidence)

@unit names the unit used for the measurement

Status Optional

Datatype data.enumerated

Suggested values include: **cm** (centimetres)

mm (millimetres)

in (inches)

lines lines of text

chars (characters) characters of text

@quantity specifies the length in the units specified

Status Optional

Datatype data.numeric

- @extent** indicates the size of the object concerned using a project-specific vocabulary combining quantity and units in a single string of words.
Status Optional
Datatype `data.text`
Values any measurement phrase, e.g. *25 letters, 2 × 3 inches*.
- ```
<gap
 extent="5 words"/>
<height
 extent="half the page"/>
```
- @precision** characterizes the precision of the values specified by the other attributes.  
*Status* Optional  
*Datatype* `data.certainty`
- @scope** where the measurement summarizes more than one observation, specifies the applicability of this measurement.  
*Status* Optional  
*Datatype* `data.enumerated`  
*Sample values include:* **all** measurement applies to all instances.  
**most** measurement applies to most of the instances inspected.  
**range** measurement applies to only the specified range of instances.

---

## **att.divLike** provides attributes common to all elements which behave in the same way as divisions. [4. Default Text Structure]

*Module* tei — The TEI Infrastructure

*Members* div div1 div2 div3 div4 div5 div6 div7 lg

*Attributes* att.metrical (*@met, @real, @rhyme*) att.fragmentable (*@part*)

- @org** (organization) specifies how the content of the division is organized.  
*Status* Optional  
*Datatype* `data.enumerated`  
*Legal values are:* **composite** no claim is made about the sequence in which the immediate contents of this division are to be processed, or their inter-relationships.  
**uniform** the immediate contents of this element are regarded as forming a logical unit, to be processed in sequence.[Default]
- @sample** indicates whether this division is a sample of the original source and if so, from which part.  
*Status* Optional  
*Datatype* `data.enumerated`  
*Legal values are:* **initial** division lacks material present at end in source.  
**medial** division lacks material at start and end.  
**final** division lacks material at start.  
**unknown** position of sampled material within original unknown.  
**complete** division is not a sample.[Default]

---

## **att.docStatus** provides attributes for use on metadata elements describing the status of a document.

*Module* tei — The TEI Infrastructure

*Members* bibl biblFull biblStruct change revisionDesc

*Attributes* Attributes

@status describes the status of a document either currently or, when associated with a dated element, at the time indicated.

*Status* Optional

*Datatype* `data.enumerated`

*Sample values include:* **approved**

**candidate**  
**cleared**  
**deprecated**  
**draft** [Default]  
**embargoed**  
**expired**  
**frozen**  
**galley**  
**proposed**  
**published**  
**recommendation**  
**submitted**  
**unfinished**  
**withdrawn**

*Example*

```
<revisionDesc status="published">
 <change when="2010-10-21" status="published"/>
 <change when="2010-10-02" status="cleared"/>
 <change when="2010-08-02" status="embargoed"/>
 <change when="2010-05-01" status="frozen" who="#MSM"/>
 <change when="2010-03-01" status="draft" who="#LB"/>
</revisionDesc>
```

---

**att.duration** provides attributes for normalization of elements that contain datable events.

*Module* spoken — Transcriptions of Speech

*Members* att.timed[`binaryObject` incident kinesic media pause u vocal writing] date gap recording time

*Attributes* att.duration.w3c (*@dur*) att.duration.iso (*@dur-iso*)

*Note* This ‘superclass’ provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.duration.w3c class are provided. If the module for names & dates is loaded, this class also provides attributes from the att.duration.iso class. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes is rarely needed, and there exists much greater software support for the W3C datatypes.

---

**att.duration.iso** provides attributes for recording normalized temporal durations. [3.5.4. *Dates and Times* 13.3.6. *Dates and Times*]

*Module* tei — The TEI Infrastructure

*Members* att.duration[att.timed[`binaryObject` incident kinesic media pause u vocal writing] date gap recording time]

*Attributes* Attributes

@dur-iso (duration) indicates the length of this element in time.

Status Optional

Datatype `data.duration.iso`

*Note* If both when and dur or dur-iso are specified, the values should be interpreted as indicating a span of time by its starting time (or date) and duration. In order to represent a time range by a duration and its ending time the when-iso attribute must be used. In providing a ‘regularized’ form, no claim is made that the form in the source text is incorrect; the regularized form is simply that chosen as the main form for purposes of unifying variant forms under a single heading.

---

## att.duration.w3c provides attributes for recording normalized temporal durations. [3.5.4. Dates and Times 13.3.6. Dates and Times]

Module tei — The TEI Infrastructure

Members att.duration[att.timed[binaryObject incident kinesic media pause u vocal writing] date gap recording time]

Attributes Attributes

@dur (duration) indicates the length of this element in time.

Status Optional

Datatype `data.duration.w3c`

*Note* If both when and dur are specified, the values should be interpreted as indicating a span of time by its starting time (or date) and duration. In order to represent a time range by a duration and its ending time the when-iso attribute must be used. In providing a ‘regularized’ form, no claim is made that the form in the source text is incorrect; the regularized form is simply that chosen as the main form for purposes of unifying variant forms under a single heading.

---

## att.edition provides attributes identifying the source edition from which some encoded feature derives.

Module tei — The TEI Infrastructure

Members cb lb milestone pb refState

Attributes Attributes

@ed (edition) supplies an arbitrary identifier for the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.

Status Optional

Datatype 1–∞ occurrences of `data.word` separated by whitespace

Values A string of characters or sigil used conventionally to identify the edition.

@edRef (edition reference) provides a pointer to the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.

Status Optional

Datatype 1–∞ occurrences of `data.pointer` separated by whitespace

Example

```
<l>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit</l>
<l>Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</l>
<l>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe,</l>
```

Example

```
<listBibl>
 <bibl xml:id="stapledon1937">
```

```

 <author>Olaf Stapledon</author>,
<title>Starmaker</title>, <publisher>Methuen</publisher>, <date>1937</date>
</bibl>
<bibl xml:id="stapledon1968">
 <author>Olaf Stapledon</author>,
<title>Starmaker</title>, <publisher>Dover</publisher>, <date>1968</date>
</bibl>
</listBibl>
<!-- -->
<p>Looking into the future aeons from the supreme moment of
the cosmos, I saw the populations still with all their
strength maintaining the<pb n="411" edRef="#stapledon1968"/>essentials of their ancient culture,
still living their personal lives in zest and endless
novelty of action, ... I saw myself still
preserving, though with increasing difficulty, my lucid
con-<pb n="291" edRef="#stapledon1937"/>sciousness;</p>

```

**att.editLike** provides attributes describing the nature of an encoded scholarly intervention or interpretation of any kind. [1. *The TEI Infrastructure*]

*Module* tei — The TEI Infrastructure

*Members* att.transcriptional[add addSpan del delSpan mod redo restore retrace subst substJoin undo] affiliation age am birth climate corr date death education event ex expan faith floruit gap geogName langKnowledge langKnown location name nationality occupation org orgName origDate origPlace origin persName person place placeName population reg relation residence sex soccecStatus state supplied surplus terrain time trait unclear

*Attributes* att.dimensions (@unit, @quantity, @extent, @precision, @scope) (att.ranging (@atLeast, @atMost, @min, @max, @confidence)) att.responsibility (@cert, @resp)

@evidence indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.enumerated` separated by whitespace

*Suggested values include:* **internal** there is internal evidence to support the intervention.

**external** there is external evidence to support the intervention.

**conjecture** the intervention or interpretation has been made by the editor, catalogueur, or scholar on the basis of their expertise.

@source contains a list of one or more pointers indicating sources supporting the given intervention or interpretation.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* A space-delimited series of sigla; each sigil should correspond to a witness or witness group and occur as the value of the xml:id attribute on a <witness> or <msDesc> element elsewhere in the document.

@instant indicates whether this is an instant revision or not.

*Status* Optional

*Datatype* `data.xTruthValue`

*Default* false

*Note* The members of this attribute class are typically used to represent any kind of editorial intervention in a text, for example a correction or interpretation, or to date or localize manuscripts etc.

## **att.enjamb** (enjambement) groups elements bearing the enjamb attribute. [6.2. Components of the Verse Line]

*Module* verse — Verse

*Members* 1

*Attributes* Attributes

**@enjamb** (enjambement) indicates that the end of a verse line is marked by enjambement.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **no** the line is end-stopped

**yes** the line in question runs on into the next

**weak** the line is weakly enjambed

**strong** the line is strongly enjambed

*Note* The usual practice will be to give the value ‘yes’ to this attribute when enjambement is being marked, or the values ‘weak’ and ‘strong’ if degrees of enjambement are of interest; if no value is given, however, the attribute does not default to a value of ‘no’; this allows the attribute to be omitted entirely when enjambement is not of particular interest.

---

## **att.entryLike** groups the different styles of dictionary entries. [9.1. Dictionary Body and Overall Structure 9.2. The Structure of Dictionary Entries]

*Module* dictionaries — Dictionaries

*Members* entry entryFree superEntry

*Attributes* Attributes

**@type** indicates type of entry, in dictionaries with multiple types.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **main** a main entry (default).[Default]

**hom** (homograph) groups information relating to one homograph within an entry.

**xref** (cross reference) a reduced entry whose only function is to point to another main entry (e.g. for forms of an irregular verb or for variant spellings: *was* pointing to *be*, or *esthete* to *aesthete*).

**affix** an entry for a prefix, infix, or suffix.

**abbr** (abbreviation) an entry for an abbreviation.

**supplemental** a supplemental entry (for use in dictionaries which issue supplements to their main work in which they include updated information about entries).

**foreign** an entry for a foreign word in a monolingual dictionary.

*Note* The global *n* attribute may be used to encode the homograph numbers attached to entries for homographs.

---

## **att.fragmentable** groups structural elements which may be fragmented, usually as a consequence of some overlapping hierarchy.

*Module* tei — The TEI Infrastructure

*Members* att.divLike[div div1 div2 div3 div4 div5 div6 div7 lg] att.segLike[c cl m pc phr s seg w] ab l p

*Attributes* Attributes

**@part** specifies whether or not its parent element is fragmented in some way, typically by some other

overlapping structure: for example a speech which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers.

*Status* Optional

*Datatype* `data.enumerated`

*Legal values are:* **Y** (yes) the element is fragmented in some (unspecified) respect

**N** (no) either the element is not fragmented, or no claim is made as to its completeness.[Default]

**I** (initial) this is the initial part of a fragmented element

**M** (medial) this is a medial part of a fragmented element

**F** (final) this is the final part of a fragmented element

*Note* The values I, M, or F should be used only where it is clear how the element may be reconstituted.

---

**att.global** provides attributes common to all elements in the TEI encoding scheme. [*1.3.1.1. Global Attributes*]

*Module* *tei* — The TEI Infrastructure

*Members* *TEI* *ab* *abbr* *accMat* *acquisition* *activity* *actor* *add* *addName* *addSpan* *additional* *additions* *addrLine* *address* *adminInfo* *affiliation* *age* *alt* *altGrp* *altIdent* *altIdentifier* *am* *analytic* *anchor* *app* *appInfo* *application* *arc* *argument* *att* *attDef* *attList* *attRef* *author* *authority* *availability* *back* *bibl* *biblFull* *biblScope* *biblStruct* *bicond* *binary* *binaryObject* *binding* *bindingDesc* *birth* *bloc* *body* *broadcast* *byline* *c* *cRefPattern* *caesura* *calendar* *calendarDesc* *camera* *caption* *case* *castGroup* *castItem* *castList* *catDesc* *catRef* *catchwords* *category* *cb* *cell* *certainty* *change* *channel* *char* *charDecl* *charName* *charProp* *choice* *cit* *citedRange* *cl* *classCode* *classDecl* *classRef* *classSpec* *classes* *climate* *closer* *code* *collation* *collection* *colloc* *colophon* *cond* *condition* *constitution* *constraint* *constraintSpec* *content* *corr* *correction* *country* *creation* *custEvent* *custodialHist* *damage* *damageSpan* *datatype* *date* *dateline* *death* *decoDesc* *decoNote* *def* *default* *defaultVal* *del* *delSpan* *depth* *derivation* *desc* *dictScrap* *dim* *dimensions* *distinct* *distributor* *district* *div* *div1* *div2* *div3* *div4* *div5* *div6* *div7* *divGen* *docAuthor* *docDate* *docEdition* *docImprint* *docTitle* *domain* *eLeaf* *eTree* *edition* *editionStmnt* *editor* *editorialDecl* *education* *eg* *egXML* *elementRef* *elementSpec* *email* *emph* *encodingDesc* *entry* *entryFree* *epigraph* *epilogue* *equipment* *equiv* *etym* *event* *ex* *exemplum* *expan* *explicit* *extent* *f* *fDecl* *fDescr* *fLib* *facsimile* *factuality* *faith* *figDesc* *figure* *fileDesc* *filiation* *finalRubric* *floatingText* *floruit* *foliation* *foreign* *forename* *forest* *form* *formula* *front* *fs* *fsConstraints* *fsDecl* *fsDescr* *fsdDecl* *fsdLink* *funder* *fvLib* *fw* *g* *gap* *gb* *gen* *genName* *geo* *geoDecl* *geogFeat* *geogName* *gi* *gloss* *glyph* *glyphName* *gram* *gramGrp* *graph* *graphic* *group* *handDesc* *handNote* *handNotes* *handShift* *head* *headItem* *headLabel* *height* *heraldry* *hi* *history* *hom* *hyph* *hyphenation* *iNode* *iType* *ident* *idno* *if* *iff* *imprimatur* *imprint* *incident* *incipit* *index* *institution* *interaction* *interp* *interpGrp* *interpretation* *item* *join* *joinGrp* *keywords* *kinesic* *l* *label* *lacunaEnd* *lacunaStart* *lang* *langKnowledge* *langKnown* *langUsage* *language* *layout* *layoutDesc* *lb* *lbl* *leaf* *lem* *lg* *licence* *line* *link* *linkGrp* *list* *listApp* *listBibl* *listChange* *listEvent* *listForest* *listNym* *listOrg* *listPerson* *listPlace* *listPrefixDef* *listRef* *listRelation* *listTranspose* *listWit* *localName* *locale* *location* *locus* *locusGrp* *m* *macroRef* *macroSpec* *mapping* *material* *measure* *measureGrp* *media* *meeting* *memberOf* *mentioned* *metDecl* *metSym* *metamark* *milestone* *mod* *moduleRef* *moduleSpec* *monogr* *mood* *move* *msContents* *msDesc* *msIdentifier* *msItem* *msItemStruct* *msName* *msPart* *musicNotation* *name* *nameLink* *namespace* *nationality* *node* *normalization* *notatedMusic* *note* *notesStmnt* *num* *number* *numeric* *nym* *oRef* *oVar* *objectDesc* *objectType* *occupation* *offset* *opener* *org* *orgName* *orig* *origDate* *origPlace* *origin* *orth* *p* *pRef* *pVar* *particDesc* *pause* *pb* *pc* *per* *performance* *persName* *person* *personGrp* *phr* *physDesc* *place* *placeName* *population* *pos* *postBox* *postCode* *postscript* *precision* *prefixDef* *preparedness* *principal* *profileDesc* *projectDesc* *prologue* *pron* *provenance* *ptr* *pubPlace* *publicationStmnt* *publisher* *purpose* *q* *quotation* *quote* *rdg* *rdgGrp* *re* *recordHist* *recording* *recordingStmnt* *redo* *ref* *refState* *refsDecl* *reg* *region* *relatedItem* *relationGrp* *remarks* *rendition* *repository* *residence* *resp* *respStmnt* *respons* *restore* *retrace* *revisionDesc* *rhyme* *role* *roleDesc* *roleName* *root* *row* *rs* *rubric* *s* *said* *salute* *samplingDecl* *schemaSpec* *scriptDesc* *scriptNote* *scriptStmnt* *seal* *sealDesc* *secFol* *seg* *segmentation* *sense* *series* *seriesStmnt* *set* *setting* *settingDesc* *settlement* *sex* *shift* *sic* *signatures* *signed* *soCalled* *socecStatus* *sound* *source* *sourceDesc* *sourceDoc* *sp* *spGrp* *space* *span* *spanGrp* *speaker* *specDesc* *specGrp* *specGrpRef* *specList*

*Attributes* att.global.linking (*@corresp*, *@synch*, *@sameAs*, *@copyOf*, *@next*, *@prev*, *@exclude*, *@select*)  
att.global.analytic (*@ana*) att.global.facs (*@facs*) att.global.change (*@change*)

**@xml:id** (identifier) provides a unique identifier for the element bearing the attribute.

*Status* Optional

*Datatype* xsd:ID

*Note* The xml:id attribute may be used to specify a canonical reference for an element; see section 3.10. *Reference Systems*.

**@n** (number) gives a number (or other label) for an element, which is not necessarily unique within the document.

*Status* Optional

*Datatype* data:text

*Values* the value consists of a single token which may however contain punctuation characters, whitespace or word separating characters. It need not be restricted to numbers.

*Note* The n attribute may be used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.

**@xml:lang** (language) indicates the language of the element content using a ‘tag’ generated according to BCP 47.

*Status* Optional

*Datatype* data:language

*Values* The value must conform to BCP 47. If the value is a private use code (i.e., starts with x- or contains x-), a <language> element with a matching value for its ident attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF)Internet Engineering Task Force definitions.

<p> ... The consequences of  
this rapid depopulation were the loss of the last  
<foreign  
xml:lang="rap">ariki</foreign> or chief  
(Routledge 1920:205,210) and their connections to  
ancestral territorial organization.</p>

*Note* the xml:lang value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify xml:lang at the highest appropriate level, noticing that a different default may be needed for the teiHeader from that needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages. The authoritative list of registered language subtags is maintained by IANA and is available at <http://www.iana.org/assignments/language-subtag-registry>. For a good general overview of the construction of language tags, see <http://www.w3.org/International/articles/language-tags/>, and for a practical step-by-step guide, see <http://www.w3.org/International/questions/qa-choosing-language-tags>.

**@rend** (rendition) indicates how the element in question was rendered or presented in the source text.

*Status* Optional

*Datatype* 1–∞ occurrences of data.word separated by whitespace

*Values* may contain any number of tokens, each of which may contain letters, punctuation marks, or symbols, but not whitespace or word-separating characters.

```
<head
 rend="align(center) case(allcaps)">
 <lb/>To The <lb/>Duchesse <lb/>of <lb/>Newcastle,
<lb/>On Her <lb/>
 <hi
 rend="case(mixed)">New Blazing-World</hi>.
</head>
```

*Note* These Guidelines make no binding recommendations for the values of the *rend* attribute; the characteristics of visual presentation vary too much from text to text and the decision to record or ignore individual characteristics varies too much from project to project. Some potentially useful conventions are noted from time to time at appropriate points in the Guidelines. The values of the *rend* attribute are a set of sequence-indeterminate individual tokens separated by whitespace.

**@style** contains an expression in some formal style definition language which defines the rendering or presentation used for this element in the source text

*Status* Optional

*Datatype* data.text

```
<head
 style="text-align: center; font-variant: small-caps">
 <lb/>To The <lb/>Duchesse <lb/>of <lb/>Newcastle, <lb/>On Her
<lb/>
 <hi
 style="font-variant: normal">New Blazing-World</hi>.
</head>
```

*Note* Unlike the attribute values of *rend*, the *style* attribute may contain whitespace. This attribute is intended for recording inline stylistic information concerning the source, not any particular output. The formal language in which values for this attribute are expressed may be specified using the `<styleDefDecl>` element in the TEI header.

**@rendition** points to a description of the rendering or presentation used for this element in the source text.

*Status* Optional

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

```
<head
 rendition="#ac #sc">
 <lb/>To The <lb/>Duchesse <lb/>of <lb/>Newcastle, <lb/>On Her
<lb/>
 <hi
 rendition="#no">New Blazing-World</hi>.
</head>
<!-- elsewhere... -->
<rendition
 xml:id="sc"
 scheme="css">font-variant: small-caps</rendition>
<rendition
 xml:id="no"
 scheme="css">font-variant: normal</rendition>
<rendition
 xml:id="ac"
 scheme="css">text-align: center</rendition>
```

*Note* The *rendition* attribute is used in a very similar way to the *class* attribute defined for XHTML but with the important distinction that its function is to describe the appearance of the source text, not necessarily to determine how that

text should be presented on screen or paper. Where both rendition and rend are supplied, the latter is understood to override or complement the former. Each URI provided should indicate a <rendition> element defining the intended rendition in terms of some appropriate style language, as indicated by the scheme attribute.

@xml:base provides a base URI reference with which applications can resolve relative URI references into absolute URI references.

*Status* Optional

*Datatype* data.pointer

```
<div
 type="bibl">

@xml:space signals an intention about how white space should be managed by applications.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **default** signals that the application's default white-space processing modes are acceptable

**preserve** indicates the intent that applications preserve all white space

*Note* The XML specification provides further guidance on the use of this attribute. Note that many parsers may not handle xml:space correctly.

**att.global.analytic** provides additional global attributes for associating specific analyses or interpretations with appropriate portions of a text. [17.3. *Spans and Interpretations*]

*Module* analysis — Simple Analytic Mechanisms

*Members* att.global[TEI ab abbr accMat acquisition activity actor add addName addSpan additional additions addrLine address adminInfo affiliation age alt altGrp altIdent altIdentifier am analytic anchor app appInfo application arc argument att attDef attList attRef author authority availability back bibl biblFull biblScope biblStruct bicond binary binaryObject binding bindingDesc birth bloc body broadcast byline c cRefPattern caesura calendar calendarDesc camera caption case castGroup castItem castList catDesc catRef catchwords category cb cell certainty change channel char charDecl charName charProp choice cit citedRange cl classCode classDecl classRef classSpec classes climate closer code collation collection colloc colophon cond condition constitution constraint constraintSpec content corr correction country creation custEvent custodialHist damage damageSpan datatype date dateline death decoDesc decoNote def default defaultVal del delSpan depth derivation desc dictScrap dim dimensions distinct distributor district div div1 div2 div3 div4 div5 div6 div7 divGen docAuthor docDate docEdition docImprint docTitle domain eLeaf eTree edition editionStmt editor editorialDecl education eg egXML elementRef elementSpec email emph encodingDesc entry entryFree epigraph epilogue equipment equiv etym event ex exemplum expan explicit extent f fDecl fDescr fLib facsimile factuality faith figDesc figure fileDesc filiation finalRubric floatingText floruit foliation foreign forename forest form formula front fs fsConstraints fsDecl fsDescr fsdDecl fsdLink funder fvLib fw g gap gb gen genName geo geoDecl geogFeat geogName gi gloss glyph glyphName gram gramGrp graph graphic group handDesc handNote handNotes handShift head headItem headLabel height heraldry hi history hom hyph hyphenation iNode iType ident idno if iff imprimatur imprint incident incipit index institution interaction interp interpGrp interpretation item join joinGrp keywords kinesic l label lacunaEnd lacunaStart lang langKnowledge langKnown langUsage language layout layoutDesc lb lbl leaf lem lg licence line link linkGrp list listApp listBibl listChange listEvent listForest listNym listOrg listPerson listPlace listPrefixDef listRef listRelation listTranspose listWit localName locale location locus locusGrp m macroRef macroSpec mapping material measure measureGrp media meeting memberOf mentioned metDecl metSym metamark milestone mod moduleRef moduleSpec monogr mood move msContents msDesc msIdentifier msItem msItemStruct msName msPart musicNotation name nameLink namespace nationality node normalization notatedMusic note notesStmt num number numeric nym oRef oVar objectDesc objectType occupation offset opener org orgName orig origDate origPlace origin orth p pRef pVar particDesc pause pb pc per performance persName person personGrp phr physDesc place placeName population pos postBox postCode postscript precision prefixDef preparedness principal profileDesc projectDesc prologue pron provenance ptr pubPlace publicationStmt publisher purpose q quotation quote rdg rdgGrp re recordHist recording recordingStmt redo ref refState refsDecl reg region relatedItem relation relationGrp remarks rendition repository residence resp respStmt respons restore retrace revisionDesc rhyme role roleDesc roleName root row rs rubric s said salute samplingDecl schemaSpec scriptDesc scriptNote scriptStmt seal sealDesc secFol seg segmentation sense series seriesStmt set setting settingDesc settlement sex shift sic signatures signed soCalled socecStatus sound source sourceDesc sourceDoc sp spGrp space span spanGrp speaker specDesc specGrp specGrpRef specList sponsor stage stamp state stdVals street stress string styleDefDecl subc subst substJoin summary superEntry supplied support supportDesc surface surfaceGrp surname surplus surrogates syll symbol table tag tagUsage tagsDecl taxonomy tech teiCorpus teiHeader term terrain text textClass textDesc textLang then time timeline title titlePage titlePart titleStmt tns trailer trait transpose tree triangle typeDesc typeNote u unclear undo unicodeName usg vAlt vColl vDefault vLabel vMerge vNot vRange val valDesc vallItem valList value variantEncoding view vocal w watermark when width wit witDetail witEnd witStart witness writing xr zone]

*Attributes* Attributes

**@ana** (analysis) indicates one or more elements containing interpretations of the element on which the ana attribute appears.

*Status* Optional

*Datatype* 1–∞ occurrences of `[data.pointer]` separated by whitespace

*Values* one or more valid identifiers of one or more interpretive elements (usually <fs> or <interp>), separated by white space.

*Note* When multiple values are given, they may reflect either multiple divergent

interpretations of an ambiguous text, or multiple mutually consistent interpretations of the same passage in different contexts.

---

**att.global.change** supplies the change attribute, allowing its member elements to specify one or more states or revision campaigns with which they are associated.

*Module* `transcr` — Representation of Primary Sources

*Attributes* `Attributes`

`@change` points to one or more `<change>` elements documenting a state or revision campaign to which the element bearing this attribute and its children have been assigned by the encoder.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

**att.global.facs** groups elements corresponding with all or part of an image, because they contain an alternative representation of it, typically but not necessarily a transcription of it. [11.1. *Digital Facsimiles*]

*Module* transcr — Representation of Primary Sources

*Members* att.global[TEI ab abbr accMat acquisition activity actor add addName addSpan additional additions addrLine address adminInfo affiliation age alt altGrp altIdent altIdentifier am analytic anchor app appInfo application arc argument att attDef attList attRef author authority availability back bibl biblFull biblScope biblStruct bicond binary binaryObject binding bindingDesc birth bloc body broadcast byline c cRefPattern caesura calendar calendarDesc camera caption case castGroup castItem castList catDesc catRef catchwords category cb cell certainty change channel char charDecl charName charProp choice cit citedRange cl classCode classDecl classRef classSpec classes climate closer code collation collection colloc colophon cond condition constitution constraint constraintSpec content corr correction country creation custEvent custodialHist damage damageSpan datatype date dateline death decoDesc decoNote def default defaultVal del delSpan depth derivation desc dictScrap dim dimensions distinct distributor district div div1 div2 div3 div4 div5 div6 div7 divGen docAuthor docDate docEdition docImprint docTitle domain eLeaf eTree edition editionStmt editor editorialDecl education eg egXML elementRef elementSpec email emph encodingDesc entry entryFree epigraph epilogue equipment equiv etym event ex exemplum expan explicit extent f fDecl fDescr fLib facsimile factuality faith figDesc figure fileDesc filiation finalRubric floatingText floruit foliation foreign forename forest form formula front fs fsConstraints fsDecl fsDescr fsdDecl fsdLink funder fvLib fw g gap gb gen genName geo geoDecl geogFeat geogName gi gloss glyph glyphName gram gramGrp graph graphic group handDesc handNote handNotes handShift head headItem headLabel height heraldry hi history hom hyph hyphenation iNode iType ident idno if iff imprimatur imprint incident incipit index institution interaction interp interpGrp interpretation item join joinGrp keywords kinesic l label lacunaEnd lacunaStart lang langKnowledge langKnown langUsage language layout layoutDesc lb lbl leaf lem lg licence line link linkGrp list listApp listBibl listChange listEvent listForest listNym listOrg listPerson listPlace listPrefixDef listRef listRelation listTranspose listWit localName locale location locus locusGrp m macroRef macroSpec mapping material measure measureGrp media meeting memberOf mentioned metDecl metSym metamark milestone mod moduleRef moduleSpec monogr mood move msContents msDesc msIdentifier msItem msItemStruct msName msPart musicNotation name nameLink namespace nationality node normalization notatedMusic note notesStmt num number numeric nym oRef oVar objectDesc objectType occupation offset opener org orgName orig origDate origPlace origin orth p pRef pVar particDesc pause pb pc per performance persName person personGrp phr physDesc place placeName population pos postBox postCode postscript precision prefixDef preparedness principal profileDesc projectDesc prologue pron provenance ptr pubPlace publicationStmt publisher purpose q quotation quote rdg rdgGrp re recordHist recording recordingStmt redo ref refState refsDecl reg region relatedItem relation relationGrp remarks rendition repository residence resp respStmt respons restore retrace revisionDesc rhyme role roleDesc roleName root row rs rubric s said salute samplingDecl schemaSpec scriptDesc scriptNote scriptStmt seal sealDesc secFol seg segmentation sense series seriesStmt set setting settingDesc settlement sex shift sic signatures signed soCalled socecStatus sound source sourceDesc sourceDoc sp spGrp space span spanGrp speaker specDesc specGrp specGrpRef specList sponsor stage stamp state stdVals street stress string styleDefDecl subc subst substJoin summary superEntry supplied support supportDesc surface surfaceGrp surname surplus surrogates syll symbol table tag tagUsage tagsDecl taxonomy tech teiCorpus teiHeader term terrain text textClass textDesc textLang then time timeline title titlePage titlePart titleStmt tns trailer trait transpose tree triangle typeDesc typeNote u unclear undo unicodeName usg vAlt vColl vDefault vLabel vMerge vNot vRange val valDesc vallItem vallList value variantEncoding view vocal w watermark when width wit witDetail witEnd witStart witness writing xr zone]

*Attributes* Attributes

@facs (facsimile) points to all or part of an image which corresponds with the content of the element.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

**att.global.linking** defines a set of attributes for hypertextual linking. [16. *Linking, Segmentation, and Alignment*]

*Module* linking — Linking, Segmentation, and Alignment

*Members* att.global[TEI ab abbr accMat acquisition activity actor add addName addSpan additional additions addrLine address adminInfo affiliation age alt altGrp altIdent altIdentifier am analytic anchor app appInfo application arc argument att attDef attList attRef author authority availability back bibl biblFull biblScope biblStruct bicond binary binaryObject binding bindingDesc birth bloc body broadcast byline c cRefPattern caesura calendar calendarDesc camera caption case castGroup castItem castList catDesc catRef catchwords category cb cell certainty change channel char charDecl charName charProp choice cit citedRange cl classCode classDecl classRef classSpec classes climate closer code collation collection colloc colophon cond condition constitution constraint constraintSpec content corr correction country creation custEvent custodialHist damage damageSpan datatype date dateline death decoDesc decoNote def default defaultVal del delSpan depth derivation desc dictScrap dim dimensions distinct distributor district div div1 div2 div3 div4 div5 div6 div7 divGen docAuthor docDate docEdition docImprint docTitle domain eLeaf eTree edition editionStm editor editorialDecl education eg egXML elementRef elementSpec email emph encodingDesc entry entryFree epigraph epilogue equipment equiv etym event ex exemplum expan explicit extent f fDecl fDescr fLib facsimile factuality faith figDesc figure fileDesc filiation finalRubric floatingText floruit foliation foreign forename forest form formula front fs fsConstraints fsDecl fsDescr fsdDecl fsdLink funder fvLib fw g gap gb gen genName geo geoDecl geogFeat geogName gi gloss glyph glyphName gram gramGrp graph graphic group handDesc handNote handNotes handShift head headItem headLabel height heraldry hi history hom hyph hyphenation iNode iType ident idno if iff imprimatur imprint incident incipit index institution interaction interp interpGrp interpretation item join joinGrp keywords kinesic l label lacunaEnd lacunaStart lang langKnowledge langKnown langUsage language layout layoutDesc lb lbl leaf lem lg licence line link linkGrp list listApp listBibl listChange listEvent listForest listNym listOrg listPerson listPlace listPrefixDef listRef listRelation listTranspose listWit localName locale location locus locusGrp m macroRef macroSpec mapping material measure measureGrp media meeting memberOf mentioned metDecl metSym metamark milestone mod moduleRef moduleSpec monogr mood move msContents msDesc msIdentifier msItem msItemStruct msName msPart musicNotation name nameLink namespace nationality node normalization notatedMusic note notesStm num number numeric nym oRef oVar objectDesc objectType occupation offset opener org orgName orig origDate origPlace origin orth p pRef pVar particDesc pause pb pc per performance persName person personGrp phr physDesc place placeName population pos postBox postCode postscript precision prefixDef preparedness principal profileDesc projectDesc prologue pron provenance ptr pubPlace publicationStm publisher purpose q quotation quote rdg rdgGrp re recordHist recording recordingStm redo ref refState refsDecl reg region relatedItem relation relationGrp remarks rendition repository residence resp respStm respons restore retrace revisionDesc rhyme role roleDesc roleName root row rs rubric s said salute samplingDecl schemaSpec scriptDesc scriptNote scriptStm seal sealDesc secFol seg segmentation sense series seriesStm set setting settingDesc settlement sex shift sic signatures signed soCalled soccStatus sound source sourceDesc sourceDoc sp spGrp space span spanGrp speaker specDesc specGrp specGrpRef specList sponsor stage stamp state stdVals street stress string styleDefDecl subc subst substJoin summary superEntry supplied support supportDesc surface surfaceGrp surname surplus surrogates syll symbol table tag tagUsage tagsDecl taxonomy tech teiCorpus teiHeader term terrain text textClass textDesc textLang then time timeline title titlePage titlePart titleStm tns trailer trait transpose tree triangle typeDesc typeNote u unclear undo unicodeName usg vAlt vColl vDefault vLabel vMerge vNot vRange val valDesc vallItem vallList value variantEncoding view vocal w watermark when width wit witDetail witEnd witStart witness writing xr zone]

*Attributes* Attributes

@corresp (corresponds) points to elements that correspond to the current element in some way.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

```

<group>
 <text
 xml:id="t1-g1-t1"
 xml:lang="mi">
 <body
 xml:id="t1-g1-t1-body1">
 <div
 type="chapter">
 <head>He Whakamaramatanga mo te Ture Hoko, Riihi hoki, i nga Whenua Maori,
1876.</head>
 <p>...</p>
 </div>
 </body>
 </text>
 <text
 xml:id="t1-g1-t2"
 xml:lang="en">
 <body
 xml:id="t1-g1-t2-body1"
 corresp="#t1-g1-t1-body1">
 <div
 type="chapter">
 <head>An Act to regulate the Sale, Letting, and Disposal of Native Lands,
1876.</head>
 <p>...</p>
 </div>
 </body>
 </text>
</group>

```

In this example a <group> contains two <text>s, each containing the same document in a different language. The correspondence is indicated using corresp. The language is indicated using xml:lang, whose value is inherited; both the tag with the corresp and the tag pointed to by the corresp inherit the value from their immediate parent.

@synch (synchronous) points to elements that are synchronous with the current element.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

@sameAs points to an element that is the same as the current element.

*Status* Optional

*Datatype* `data.pointer`

@copyOf points to an element of which the current element is a copy.

*Status* Optional

*Datatype* `data.pointer`

*Note* Any content of the current element should be ignored. Its true content is that of the element being pointed at.

@next points to the next element of a virtual aggregate of which the current element is part.

*Status* Optional

*Datatype* `data.pointer`

@prev (previous) points to the previous element of a virtual aggregate of which the current element is part.

*Status* Optional

*Datatype* `data.pointer`

@exclude points to elements that are in exclusive alternation with the current element.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

**@select** selects one or more alternants; if one alternant is selected, the ambiguity or uncertainty is marked as resolved. If more than one alternant is selected, the degree of ambiguity or uncertainty is marked as reduced by the number of alternants not selected.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Note* This attribute should be placed on an element which is superordinate to all of the alternants from which the selection is being made.

---

**att.handFeatures** provides attributes describing aspects of the hand in which a manuscript is written. [11.3.2.1. Document Hands]

*Module* `tei` — The TEI Infrastructure

*Members* `handNote` `handShift` `scriptNote` `typeNote`

*Attributes* Attributes

**@scribe** gives a name or other identifier for the scribe believed to be responsible for this hand.

*Status* Optional

*Datatype* `data.name`

**@scribeRef** points to a full description of the scribe concerned, typically supplied by a `<person>` element elsewhere in the description.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

**@script** characterizes the particular script or writing style used by this hand, for example *secretary*, *copperplate*, *Chancery*, *Italian*, etc.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.name` separated by whitespace

**@scriptRef** points to a full description of the script or writing style used by this hand, typically supplied by a `<scriptNote>` element elsewhere in the description.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

**@medium** describes the tint or type of ink, e.g. *brown*, or other writing medium, e.g. *pencil*

*Status* Optional

*Datatype* `data.enumerated`

**@scope** specifies how widely this hand is used in the manuscript.

*Status* Optional

*Datatype* `data.enumerated`

*Legal values are:* **sole** only this hand is used throughout the manuscript

**major** this hand is used through most of the manuscript

**minor** this hand is used occasionally in the manuscript

*Note* Usually either `script` or `scriptRef`, and similarly, either `scribe` or `scribeRef`, will be supplied.

---

**att.identified** provides the identifying attribute for elements which can be subsequently referenced by means of a key attribute.

*Module* `tagdocs` — Documentation Elements

*Members* `attDef` `classSpec` `constraintSpec` `elementSpec` `macroSpec` `moduleSpec` `schemaSpec`

*Attributes* `att.combinable` (*@mode*) (*att.deprecated* (*@validUntil*))

**@ident** supplies the identifier by which this element may be referenced.

*Status* Required

*Datatype* `data.name`

**@predeclare** says whether this object should be predeclared in the tei infrastructure module.

*Status* Optional

*Datatype* `data.truthValue`

*Default* false

**@module** supplies a name for the module in which this object is to be declared.

*Status* Optional

*Datatype* `data.xmlName`

*Values* a name of module

**@status** indicates the current status of the object identified with respect to the current version of the TEI Guidelines.

*Deprecated* will be removed on 2015-06-19

*Status* Optional

*Datatype* `data.enumerated`

*Legal values are:* **deprecated** the item is not recommended for use, and may be withdrawn at a future release.

**unstable** the item is new and still under review.

**changed** the item has changed significantly since the preceding version.

**stable** the item has not recently changed and is not expected to do so except for correction of any errors.[Default]

*Schematron* `<s:rule context="tei:elementSpec[@module]|tei:classSpec[@module]|tei:macroSpec[@module]">  
 <s:assert test="(not(ancestor::tei:schemaSpec | ancestor::tei:TEI | ancestor::tei:teiCorpus)) or (not(@module  
 or (not(//tei:moduleSpec) and not(//tei:moduleRef)) or (//tei:moduleSpec[@ident = current()/@module]) or  
 (//tei:moduleRef[@key = current()/@module])) "> Specification <s:value-of select="@ident"/>: the value of  
 the module attribute ("<s:value-of select="@module"/>") should correspond to an existing module, via a  
 moduleSpec or moduleRef</s:assert></s:rule>`

**att.internetMedia** provides attributes for specifying the type of a computer resource using a standard taxonomy.

*Module* tei — The TEI Infrastructure

*Members* att.media[binaryObject graphic] equiv ptr ref

*Attributes* Attributes

**@mimeType** (MIME media type) specifies the applicable multimedia internet mail extension (MIME) media type

*Status* Optional

*Datatype* 1–∞ occurrences of `data.word` separated by whitespace

*Values* The value should be a valid MIME media type

*Example* In this example mimeType is used to indicate the URL points to a TEI XML file encoded in UTF-8.

```
<ref
 mimeType="application/tei+xml; charset=UTF-8"
 target="http://sourceforge.net/p/tei/code/HEAD/tree/trunk/P5/Source/guidelines-en.xml"/>
```

*Note* This attribute class provides attributes for describing a computer resource, typically available over the internet, according to standard taxonomies. At present only a single taxonomy is supported, the Multipurpose Internet Mail Extensions Media Type system. This system of typology of media types is defined by the Internet Engineering Task Force in RFC 2046. The list of types is maintained by the Internet Assigned Numbers Authority.

**att.interpLike** provides attributes for elements which represent a formal analysis or interpretation. [17.2. *Global Attributes for Simple Analyses*]

*Module* tei — The TEI Infrastructure

*Members* interp interpGrp span spanGrp

*Attributes* att.responsibility (@cert, @resp)

@type indicates what kind of phenomenon is being noted in the passage.

*Status* Recommended

*Datatype* data.enumerated

*Sample values include:* **image** identifies an image in the passage.

**character** identifies a character associated with the passage.

**theme** identifies a theme in the passage.

**allusion** identifies an allusion to another text.

@inst (instances) points to instances of the analysis or interpretation represented by the current element.

*Status* Optional

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

*Note* The current element should be an analytic one. The element pointed at should be a textual one.

**att.lexicographic** defines a set of global attributes available on elements in the base tag set for dictionaries. [9.2. *The Structure of Dictionary Entries*]

*Module* dictionaries — Dictionaries

*Members* case colloc def entryFree etym form gen gram gramGrp hom hyph iType lang lbl mood number oRef oVar orth pRef pVar per pos pron re sense subc syll tns usg xr

*Attributes* att.datcat (@datcat, @valueDatcat)

@expand gives an expanded form of information presented more concisely in the dictionary

*Status* Optional

*Datatype* text

<gramGrp>

<pos>n</pos>

</gramGrp>

@norm (normalized) gives a normalized form of information given by the source text in a non-normalized form

*Status* Optional

*Datatype* data.text

<gramGrp>

<pos

norm="noun">n</pos>

</gramGrp>

@split gives the list of split values for a merged form

*Status* Optional

*Datatype* data.text

@value gives a value which lacks any realization in the printed source text.

*Status* Optional

*Datatype* data.text

@orig (original) gives the original string or is the empty string when the element does not appear in the source text.

*Status* Optional

*Datatype* `data.text`

**@location** provides a reference to an <anchor> element typically elsewhere in the document, but possibly in another document, indicating the original location of this component.

*Status* Optional

*Datatype* `data.pointer`

*Values* a valid identifier for an <anchor> element elsewhere in the current document.

**@mergedIn** gives a reference to another element, where the original appears as a merged form.

*Status* Optional

*Datatype* `data.pointer`

**@opt** (optional) indicates whether the element is optional or not

*Status* Optional

*Datatype* `data.truthValue`

*Default* false

---

**att.measurement** provides attributes to represent a regularized or normalized measurement.

*Module* tei — The TEI Infrastructure

*Members* measure measureGrp

*Attributes* Attributes

**@unit** indicates the units used for the measurement, usually using the standard symbol for the desired units.

*Status* Optional

*Datatype* `data.enumerated`

*Suggested values include:* **m** (metre) SI base unit of length

**kg** (kilogram) SI base unit of mass

**s** (second) SI base unit of time

**Hz** (hertz) SI unit of frequency

**Pa** (pascal) SI unit of pressure or stress

**Ω** (ohm) SI unit of electric resistance

**L** (litre) 1 dm<sup>3</sup>

**t** (tonne) 10<sup>3</sup> kg

**ha** (hectare) 1 hm<sup>2</sup>

**Å** (ångström) 10<sup>-10</sup> m

**mL** (millilitre)

**cm** (centimetre)

**dB** (decibel) see remarks, below

**kbit** (kilobit) 10<sup>3</sup> or 1000 bits

**Kibit** (kibibit) 2<sup>10</sup> or 1024 bits

**kB** (kilobyte) 10<sup>3</sup> or 1000 bytes

**KiB** (kibibyte) 2<sup>10</sup> or 1024 bytes

**MB** (megabyte) 10<sup>6</sup> or 1 000 000 bytes

**MiB** (mebibyte) 2<sup>20</sup> or 1 048 576 bytes

*Note* If the measurement being represented is not expressed in a particular unit, but rather is a number of discrete items, the unit count should be used, or the unit attribute may be left unspecified. Wherever appropriate, a recognized SI unit name should be used (see further <http://www.bipm.org/en/si/>; <http://physics.nist.gov/cuu/Units/>). The

list above is indicative rather than exhaustive.

**@quantity** specifies the number of the specified units that comprise the measurement

*Status* Optional

*Datatype* `data.numeric`

**@commodity** indicates the substance that is being measured

*Status* Optional

*Datatype* 1–∞ occurrences of `data.word` separated by whitespace

*Note* In general, when the commodity is made of discrete entities, the plural form should be used, even when the measurement is of only one of them.

*Note* This attribute class provides a triplet of attributes that may be used either to regularize the values of the measurement being encoded, or to normalize them with respect to a standard measurement system.

```
<l>
<!-- regularization:-->
So weren't you gonna buy <measure quantity="0.5" unit="gal" commodity="ice cream">half
a gallon</measure>, baby
</l>
<l>
<!-- normalization: -->
So won't you go and buy <measure quantity="1.893" unit="L" commodity="ice cream">half
a gallon</measure>, baby?
</l>
```

*Note* The unit should normally be named using the standard abbreviation for an SI unit (see further <http://www.bipm.org/en/si/>; <http://physics.nist.gov/cuu/Units/>). However, encoders may also specify measurements using informally defined units such as lines or characters.

---

## **att.media** provides attributes for specifying display and related properties of external media.

*Module* `tei` — The TEI Infrastructure

*Members* `binaryObject` `graphic`

*Attributes* `att.internetMedia` (*@mimeType*)

**@width** Where the media are displayed, indicates the display width

*Status* Optional

*Datatype* `data.outputMeasurement`

**@height** Where the media are displayed, indicates the display height

*Status* Optional

*Datatype* `data.outputMeasurement`

**@scale** Where the media are displayed, indicates a scale factor to be applied when generating the desired display size

*Status* Optional

*Datatype* `data.numeric`

---

## **att.metrical** defines a set of attributes which certain elements may use to represent metrical information. [6.3.

*Rhyme and Metrical Analysis*]

*Module* `verse` — Verse

*Members* `att.divLike`[`div` `div1` `div2` `div3` `div4` `div5` `div6` `div7` `lg`] `att.segLike`[`c` `cl` `m` `pc` `phr` `s` `seg` `w`] `l`

*Attributes* `Attributes`

- @met** (metrical structure, conventional) contains a user-specified encoding for the conventional metrical structure of the element.  
*Status* Recommended  
*Datatype* token  
*Values* May contain either a standard term for the kind of metrical unit (e.g. *hexameter*) or an encoded representation for the metrical pattern (e.g. +---+---+---). In either case, the notation used should be documented by a <metDecl> element within the <encodingDesc> of the associated header.  
*Note* Where this attribute is not specified, the metrical pattern for the element concerned is understood to be inherited from its parent.
- @real** (metrical structure, realized) contains a user-specified encoding for the actual realization of the conventional metrical structure applicable to the element.  
*Status* Optional  
*Datatype* token  
*Values* May contain either a standard term for the kind of metrical unit (e.g. *hexameter*) or an encoded representation for the metrical pattern (e.g. +---+---+---). In either case, the notation used should be documented by a <metDecl> element within the <encodingDesc> of the associated header.  
*Note* Where this attribute is not specified, the metrical realization for the element concerned is understood to be identical to that specified or implied for the met attribute.
- @rhyme** (rhyme scheme) specifies the rhyme scheme applicable to a group of verse lines.  
*Status* Recommended  
*Datatype* token  
*Values* By default, the rhyme scheme is expressed as a string of alphabetic characters each corresponding with a rhyming line. Any non-rhyming lines should be represented by a hyphen or an X. Alternative notations may be defined as for met by use of the <metDecl> element in the TEI header.  
*Note* When the default notation is used, it does not make sense to specify this attribute on any unit smaller than a line. Nor does the default notation provide any way to record internal rhyme, or to specify non-conventional rhyming practice. These extensions would require user-defined alternative notations.

---

**att.milestoneUnit** provides an attribute to indicate the type of section which is changing at a specific milestone.  
 [3.10.3. Milestone Elements 2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration]

*Module* core — Elements Available in All TEI Documents

*Members* milestone refState

*Attributes* Attributes

- @unit** provides a conventional name for the kind of section changing at this milestone.  
*Status* Required  
*Datatype* data.enumerated  
*Suggested values include:* **page** physical page breaks (synonymous with the <pb> element).  
**column** column breaks.  
**line** line breaks (synonymous with the <lb> element).  
**book** any units termed book, liber, etc.  
**poem** individual poems in a collection.  
**canto** cantos or other major sections of a poem.  
**speaker** changes of speaker or narrator.  
**stanza** stanzas within a poem, book, or canto.

**act** acts within a play.  
**scene** scenes within a play or act.  
**section** sections of any kind.  
**absent** passages not present in the reference edition.  
**unnumbered** passages present in the text, but not to be included as part of the reference.

```
<milestone
 n="23"
 ed="La"
 unit="Dreissiger"/>
... <milestone
 n="24"
 ed="AV"
 unit="verse"/> ...
```

*Note* If the milestone marks the beginning of a piece of text not present in the reference edition, the special value *absent* may be used as the value of unit. The normal interpretation is that the reference edition does not contain the text which follows, until the next <milestone> tag for the edition in question is encountered. In addition to the values suggested, other terms may be appropriate (e.g. *Stephanus* for the Stephanus numbers in Plato).

---

**att.msExcerpt** (manuscript excerpt) provides attributes used to describe excerpts from a manuscript placed in a description thereof. [10.6. Intellectual Content]

*Module* msdescription — Manuscript Description

*Members* explicit incipit msContents msItem msItemStruct quote

*Attributes* Attributes

**@defective** indicates whether the passage being quoted is defective, i.e. incomplete through loss or damage.

*Status* Optional

*Datatype* data.xTruthValue

*Default* false

*Note* In the case of an incipit, indicates whether the incipit as given is defective, i.e. the first words of the text as preserved, as opposed to the first words of the work itself. In the case of an explicit, indicates whether the explicit as given is defective, i.e. the final words of the text as preserved, as opposed to what the closing words would have been had the text of the work been whole.

---

**att.namespaceable** provides an attribute indicating the target namespace for an object being created

*Module* tagdocs — Documentation Elements

*Members* elementSpec schemaSpec

*Attributes* Attributes

**@ns** (namespace) specifies the namespace to which this element belongs

*Status* Optional

*Datatype* data.namespace

*Default* http://www.tei-c.org/ns/1.0

---

**att.naming** provides attributes common to elements which refer to named persons, places, organizations etc. [3.5.1. Referring Strings 13.3.5. Names and Nyms]

*Module* tei — The TEI Infrastructure

*Members* att.personal[addName forename genName name orgName persName placeName roleName surname] affiliation author birth bloc climate collection country death district editor education event geogFeat geogName institution nationality occupation origPlace population pubPlace region repository residence rs settlement socecStatus state terrain trait

*Attributes* att.canonical (@key, @ref)

@role may be used to specify further information about the entity referenced by this name, for example the occupation of a person, or the status of a place.

*Status* Optional

*Datatype* `data.enumerated`

@nymRef (reference to the canonical name) provides a means of locating the canonical form (*nym*) of the names associated with the object named by the element bearing it.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Note* The value must point directly to one or more XML elements by means of one or more URIs, separated by whitespace. If more than one is supplied, the implication is that the name is associated with several distinct canonical names.

---

**att.patternReplacement** provides attributes for regular-expression matching and replacement. [16.2.3. Using Abbreviated Pointers 2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration 2.3.6.2. Search-and-Replace Method]

*Module* header — The TEI Header

*Members* cRefPattern prefixDef

*Attributes* Attributes

@matchPattern specifies a regular expression against which the values of other attributes can be matched.

*Status* Required

*Datatype* `data.pattern`

*Values* must be a regular expression according to the W3C XML Schema Language

*Note* Parenthesized groups are used not only for establishing order of precedence and atoms for quantification, but also for creating subpatterns to be referenced by the replacementPattern attribute.

@replacementPattern specifies a ‘replacement pattern’ which, once subpattern substitution has been performed, provides a URI.

*Status* Required

*Datatype* `data.replacement`

*Values* Should be the skeleton of a relative or absolute URI, with references to groups in the matchPattern.

*Note* The strings ‘\$1’ through ‘\$9’ are references to the corresponding group in the regular expression specified by matchPattern (counting open parenthesis, left to right). Processors are expected to replace them with whatever matched the corresponding group in the regular expression. If a digit preceded by a dollar sign is needed in the actual replacement pattern (as opposed to being used as a back reference), the dollar sign must be written as %24.

---

**att.personal** (attributes for components of names usually, but not necessarily, personal names) common attributes

for those elements which form part of a name usually, but not necessarily, a personal name. [13.2.1. *Personal Names*]

*Module* tei — The TEI Infrastructure

*Members* addName forename genName name orgName persName placeName roleName surname

*Attributes* att.naming (@role, @nymRef) (att.canonical (@key, @ref))

@full indicates whether the name component is given in full, as an abbreviation or simply as an initial.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **yes** the name component is spelled out in full.[Default]

**abb** (abbreviated) the name component is given in an abbreviated form.

**init** (initial letter) the name component is indicated only by one initial.

@sort specifies the sort order of the name component in relation to others within the name.

*Status* Optional

*Datatype* data.count

*Values* A positive number indicating the sort order.

---

**att.placement** provides attributes for describing where on the source page or object a textual element appears. [3.4.3. *Additions, Deletions, and Omissions* 11.3.1.4. *Additions and Deletions*]

*Module* tei — The TEI Infrastructure

*Members* add addSpan figure fw label metamark notatedMusic note witDetail

*Attributes* Attributes

@place specifies where this item is placed

*Status* Recommended

*Datatype* 1–∞ occurrences of data.enumerated separated by whitespace

*Suggested values include:* **below** below the line

**bottom** at the foot of the page

**margin** in the margin (left, right, or both)

**top** at the top of the page

**opposite** on the opposite, i.e. facing, page

**overleaf** on the other side of the leaf

**above** above the line

**end** at the end of e.g. chapter or volume.

**inline** within the body of the text.

**inspace** in a predefined space, for example left by an earlier scribe.

**<add**

place="margin">[An addition written in the margin]</add>

**<add**

place="bottom opposite">[An addition written at the foot of the current page and also on the facing page]</add>

**<note**

place="bottom">Ibid, p.7</note>

---

**att.pointing** defines a set of attributes used by all elements which point to other elements by means of one or more URI references. [1.3.1.1.2. *Language Indicators* 3.6. *Simple Links and Cross-References*]

*Module* tei — The TEI Infrastructure

*Members* att.pointing.group[altGrp joinGrp linkGrp] calendar catRef citedRange gloss join licence link locus note  
oRef oVar pRef pVar ptr ref span substJoin term witDetail

*Attributes* Attributes

**@targetLang** specifies the language of the content to be found at the destination referenced by target, using a 'language tag' generated according to BCP 47.

*Status* Optional

*Datatype* `data.language`

*Schematron* `<sch:rule context="tei:*[not(self::tei:schemaSpec)][@targetLang]">  
<sch:assert test="count(@target)">@targetLang can only be used if @target is  
specified.</sch:assert></sch:rule>`

*Values* The value must conform to BCP 47. If the value is a private use code (i.e., starts with x- or contains x-), a `<language>` element with a matching value for its ident attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF)Internet Engineering Task Force definitions.

**<linkGrp**

xml:id="pol-swh\_aln\_2.1-linkGrp">

**<ptr**

xml:id="pol-swh\_aln\_2.1.1-ptr"

target="pol/UDHR/text.xml#pol\_txt\_1-head"

type="tuv"

targetLang="pl"/>

**<ptr**

xml:id="pol-swh\_aln\_2.1.2-ptr"

target="sw/UDHR/text.xml#swh\_txt\_1-head"

type="tuv"

targetLang="sw"/>

**</linkGrp>**In the example above, the `<linkGrp>` combines pointers at parallel fragments of the *Universal Declaration of Human Rights*: one of them is in Polish, the other in Swahili.

**@target** specifies the destination of the reference by supplying one or more URI References

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* One or more syntactically valid URI references, separated by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. TEI%20Consortium.

**@evaluate** specifies the intended meaning when the target of a pointer is itself a pointer.

*Status* Optional

*Datatype* `data.enumerated`

*Legal values are:* **all** if the element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.

**one** if the element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.

**none** no further evaluation of targets is carried out beyond that needed to find the element specified in the pointer's target.

*Note* If no value is given, the application program is responsible for deciding (possibly on the basis of user input) how far to trace a chain of pointers.

---

**att.pointing.group** defines a set of attributes common to all elements which enclose groups of pointer elements. [16. *Linking, Segmentation, and Alignment*]

*Module* tei — The TEI Infrastructure

*Members* altGrp joinGrp linkGrp

*Attributes* att.pointing (@targetLang, @target, @evaluate) att.typed (@type, @subtype)

@domains optionally specifies the identifiers of the elements within which all elements indicated by the contents of this element lie.

*Status* Optional

*Datatype* 2–∞ occurrences of `data.pointer` separated by whitespace

*Note* If this attribute is supplied every element specified as a target must be contained within the element or elements named by it. An application may choose whether or not to report failures to satisfy this constraint as errors, but may not access an element of the right identifier but in the wrong context. If this attribute is not supplied, then target elements may appear anywhere within the target document.

@targFunc (target function) describes the function of each of the values of the target attribute of the enclosed <link>, <join>, or <alt> tags.

*Status* Optional

*Datatype* 2–∞ occurrences of `data.word` separated by whitespace

*Note* The number of separate values must match the number of values in the target attribute in the enclosed <link>, <join>, or <alt> tags (an intermediate <ptr> element may be needed to accomplish this). It should also match the number of values in the domains attribute, of the current element, if one has been specified.

---

**att.ranging** provides attributes for describing numerical ranges.

*Module* tei — The TEI Infrastructure

*Members* att.dimensions[att.damaged[damage damageSpan] att.editLike[att.transcriptional[add addSpan del delSpan mod redo restore retrace subst substJoin undo] affiliation age am birth climate corr date death education event ex expan faith floruit gap geogName langKnowledge langKnown location name nationality occupation org orgName origDate origPlace origin persName person place placeName population reg relation residence sex socecStatus state supplied surplus terrain time trait unclear] depth dim dimensions height space width] num

*Attributes* Attributes

@atLeast gives a minimum estimated value for the approximate measurement.

*Status* Optional

*Datatype* `data.numeric`

@atMost gives a maximum estimated value for the approximate measurement.

*Status* Optional

*Datatype* `data.numeric`

@min where the measurement summarizes more than one observation or a range, supplies the minimum value observed.

*Status* Optional

*Datatype* `data.numeric`

@max where the measurement summarizes more than one observation or a range, supplies the maximum value observed.

*Status* Optional

*Datatype* `data.numeric`

@confidence specifies the degree of statistical confidence (between zero and one) that a value falls within the range specified by min and max, or the proportion of observed values that fall within that range.

*Status* Optional

*Datatype* `data.probability`

**att.rdgPart** attributes for elements which mark the beginning or ending of a fragmentary manuscript or other witness. [12.1.5. Fragmentary Witnesses]

*Module* textcrit — Critical Apparatus

*Members* lacunaEnd lacunaStart wit witEnd witStart

*Attributes* Attributes

**@wit** (witness or witnesses) contains a list of one or more sigla indicating the witnesses which begin or end at this point.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* A space-delimited series of sigla; each sigil should correspond to a witness or witness group and occur as the value of the `xml:id` attribute on a `<witness>` element at the location pointed to, typically but not necessarily elsewhere in the same document.

*Note* These elements may appear anywhere within the elements `<lem>` and `<rdg>`, and also within any of their constituent elements.

---

**att.readFrom** groups specification elements which derive components from some external source.

*Module* tei — The TEI Infrastructure

*Members* classRef elementRef macroRef moduleRef schemaSpec

*Attributes* Attributes

**@source** specifies the source from which declarations and definitions for the components of the object being defined may be obtained.

*Status* Optional

*Datatype* `data.pointer`

*Note* The context indicated must provide a set of TEI-conformant specifications in a form directly usable by an ODD processor. By default, this will be the location of the current release of the TEI Guidelines. The source may be specified in the form of a private URI, for which the form recommended is `tei:x.y.z`, where `x.y.z` indicates the version number, e.g. `tei:1.5.1` for 1.5.1 release of TEI P5 or (as a special case) `tei:current` for whatever is the latest release.

---

**att.resourced** provides attributes by which a resource (such as an externally held media file) may be located.

*Module* tei — The TEI Infrastructure

*Members* graphic media

*Attributes* Attributes

**@url** (uniform resource locator) specifies the URL from which the media concerned may be obtained.

*Status* Required

*Datatype* `data.pointer`

---

**att.responsibility** provides attributes indicating who is responsible for something asserted by the markup and the degree of certainty associated with it. [3.4. Simple Editorial Changes 17.3. Spans and Interpretations 13.1.1. Linking Names and their Referents]

*Module* tei — The TEI Infrastructure

*Members* att.editLike[att.transcriptional[add addSpan del delSpan mod redo restore retrace subst substJoin undo] affiliation age am birth climate corr date death education event ex expan faith floruit gap geogName langKnowledge langKnown location name nationality occupation org orgName origDate origPlace origin persName person place placeName population reg relation residence sex socecStatus state supplied surplus terrain time trait unclear] att.interpLike[interp interpGrp span spanGrp] att.textCritical[lem rdg rdgGrp] abbr handShift note orig provenance seg sic witDetail

*Attributes* Attributes

@cert (certainty) signifies the degree of certainty associated with the intervention or interpretation.

*Status* Optional

*Datatype* `data.certainty`

@resp (responsible party) indicates the agency responsible for the intervention or interpretation, for example an editor or transcriber.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* A pointer to an element typically, but not necessarily, in the document header that is associated with a person asserted as responsible for some aspect of the text's creation, transcription, editing, or encoding.

*Example*

```
Blessed are the
<choice>
 <sic>placemakers</sic>
 <corr resp="#editor" cert="high">peacemakers</corr>
</choice>: for they shall be called the children of God.
```

---

**att.scoping** provides attributes for selecting particular elements within a document by means of XPath.

*Module* tei — The TEI Infrastructure

*Members* certainty precision respons

*Attributes* Attributes

@target points at one or several elements or sets of elements by means of one or more data pointers, using the URI syntax.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

```
Elizabeth went
to <persName
 xml:id="ESSEX">Essex</persName>
<certainty
 target="#ESSEX"
 locus="name"
 degree="0.6"/>
```

*Note* If more than one identifier is given, the implication is that all elements (or nodesets) are intended. The match attribute may also be used as a means of identifying groups of elements.

@match supplies an arbitrary XPath expression identifying a set of nodes, selected within the context identified by the target attribute if this is supplied, or within the context of the element bearing this attribute if it is not.

*Status* Optional

*Datatype* `text`

*Values* Any XPath expression using the syntax defined in Kay (ed.) (2007).

```

<gap
 reason="cancelled">
 <certainty
 match="parent::tei:gap/@reason"
 locus="value"
 cert="low"/>
 </gap>

```

*Note* The expression of certainty applies to the nodeset identified by the value of the target attribute, possibly modified additionally by the value of the match attribute. If neither attribute is present, the expression of certainty applies to the context of the <certainty> element itself, i.e. its parent element. Note that the value of the target attribute may include an XPointer expression including an XPath expression (see 16.2.5. *TEI XPointer Schemes*).

---

**att.segLike** provides attributes for elements used for arbitrary segmentation. [16.3. *Blocks, Segments, and Anchors* 17.1. *Linguistic Segment Categories*]

*Module* tei — The TEI Infrastructure

*Members* c cl m pc phr s seg w

*Attributes* att.metrical (@met, @real, @rhyme) att.datcat (@datcat, @valueDatcat) att.fragmentable (@part)

@function characterizes the function of the segment.

*Status* Optional

*Datatype* data.enumerated

*Values* For a <cl>, may take values such as coordinate, subject, adverbial etc. For a <phr>, such values as subject, predicate etc. may be more appropriate.

---

**att.sortable** provides attributes for elements in lists or groups that are sortable, but whose sorting key cannot be derived mechanically from the element content. [1. *The TEI Infrastructure*]

*Module* tei — The TEI Infrastructure

*Members* bibl biblFull biblStruct entry entryFree event idno item list listApp listBibl listChange listEvent listNym listOrg listPerson listPlace listRelation listWit msDesc nym org person personGrp place relation relationGrp superEntry term witness

*Attributes* Attributes

@sortKey supplies the sort key for this element in an index, list or group which contains it.

*Status* Optional

*Datatype* data.word

*Values* a sequence of characters which, when sorted with the other values, will produced the desired order; specifics of sort key construction are application-dependent.

David's other principal backer, Josiah

ha-Kohen <index

indexName="NAMES">

<term

sortKey="Azarya\_Josiah\_Kohen">Josiah ha-Kohen b. Azarya</term>

</index> b. Azarya, son of one of the last gaons of Sura was David's own first cousin.

*Note* The sort key is used to determine the sequence and grouping of entries in an index. Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under 'fourh', and McCoy may be alphabetized under 'maccoy', while A1, A4, and A5 may all appear in numeric order 'alphabetized'

between 'a-' and 'AA'. The sort key is required if the orthography of the dictionary entry does not suffice to determine its location.

---

**att.source** provides attributes for pointing to the source of a bibliographic reference. [3.3.3. *Quotation* 8.3.4. *Writing*]

*Module* tei — The TEI Infrastructure

*Members* egXML q quote writing

*Attributes* Attributes

@source (pointer to a bibliographical source reference) provides a pointer to the bibliographical source from which a quotation or citation is drawn.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* Must point to one or more bibliographic elements in the TEI header or elsewhere

*Example*

```
<p>
<!-- ... -->
As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>)
tells us, <quote source="#mcc_2012">'Collaboration' is a
problematic and should be a contested term.</quote>
<!-- ... -->
</p>
```

*Example*

```
<p>
<!-- ... -->
<quote source="#chicago_15_ed">Grammatical theories
are in flux, and the more we learn, the less we
seem to know.</quote>
<!-- ... -->
</p>
<!-- ... -->
<bibl xml:id="chicago_15_ed">
<title level="m">The Chicago Manual of Style</title>,
<edition>15th edition</edition>.
<pubPlace>Chicago</pubPlace>:
<publisher>University of Chicago Press</publisher>
(<date>2003</date>),
<biblScope unit="page">p.147</biblScope>.

</bibl>
```

---

**att.spanning** provides attributes for elements which delimit a span of text by pointing mechanisms rather than by enclosing it. [1.3.1. *Attribute Classes*]

*Module* tei — The TEI Infrastructure

*Members* addSpan cb damageSpan delSpan gb index lb metamark milestone mod pb redo retrace undo

*Attributes* Attributes

@spanTo indicates the end of a span initiated by the element bearing this attribute.

*Status* Optional

*Datatype* `data.pointer`

*Schematron* The @spanTo attribute must point to an element following the current element<sch:rule context="tei:\*[@spanTo]"> <sch:assert test="id(substring(@spanTo,2)) and following::\*[@xml:id=substring(current()/@spanTo,2)]">The element indicated by @spanTo (<sch:value-of select="@spanTo"/>) must follow the current element <sch:name/> </sch:assert></sch:rule>

*Values* points to an element following this one in the current document.

*Note* The span is defined as running in document order from the start of the content of the pointing element to the end of the content of the element pointed to by the spanTo attribute (if any). If no value is supplied for the attribute, the assumption is that the span is coextensive with the pointing element. If no content is present, the assumption is that the starting point of the span is immediately following the element itself.

---

**att.styleDef** groups elements which specify the name of a formal definition language used to provide formatting or rendition information.

*Module* tei — The TEI Infrastructure

*Members* rendition styleDefDecl

*Attributes* Attributes

@scheme identifies the language used to describe the rendition.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **css** Cascading Stylesheet Language

**xslfo** Extensible Stylesheet Language Formatting Objects

**free** Informal free text description

**other** A user-defined rendition description language

*Note* If no value for the @scheme attribute is provided, then the default assumption should be that CSS is in use.

@schemeVersion supplies a version number for the style language provided in scheme.

*Status* Optional

*Datatype* data.versionNumber

*Schematron* <sch:rule context="tei:\*[@schemeVersion]"> <sch:assert test="@scheme and not(@scheme = 'free')"> @schemeVersion can only be used if @scheme is specified. </sch:assert></sch:rule>

*Note* If schemeVersion is used, then scheme should also appear, with a value other than free.

---

**att.tableDecoration** provides attributes used to decorate rows or cells of a table. [14. Tables, Formulæ, Graphics and Notated Music]

*Module* tei — The TEI Infrastructure

*Members* cell row

*Attributes* Attributes

@role indicates the kind of information held in this cell or in each cell of this row.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **label** labelling or descriptive information only.

**data** data values.[Default]

*Note* When this attribute is specified on a row, its value is the default for all cells in this row. When specified on a cell, its value overrides any default specified by the role attribute of the parent <row> element.

**@rows** indicates the number of rows occupied by this cell or row.

*Status* Optional

*Datatype* `data.count`

*Default* 1

*Values* A number; a value greater than one indicates that this cell (or row) spans several rows.

*Note* Where several cells span several rows, it may be more convenient to use nested tables.

**@cols** (columns) indicates the number of columns occupied by this cell or row.

*Status* Optional

*Datatype* `data.count`

*Default* 1

*Values* A number; a value greater than one indicates that this cell or row spans several columns.

*Note* Where an initial cell spans an entire row, it may be better treated as a heading.

---

**att.textCritical** defines a set of attributes common to all elements representing variant readings in text critical work. [12.1. The Apparatus Entry, Readings, and Witnesses]

*Module* textcrit — Critical Apparatus

*Members* lem rdg rdgGrp

*Attributes* att.responsibility (@cert, @resp)

**@type** classifies the reading according to some useful typology.

*Status* Optional

*Datatype* `data.enumerated`

*Sample values include:* **substantive** the reading offers a substantive variant.

**orthographic** the reading differs only orthographically, not in substance, from other readings.

**@cause** classifies the cause for the variant reading, according to any appropriate typology of possible origins.

*Status* Optional

*Datatype* `data.enumerated`

*Sample values include:* **homeoteleuton**

**homeoarchy**

**paleographicConfusion**

**haplography**

**dittography**

**falseEmendation**

**@varSeq** (variant sequence) provides a number indicating the position of this reading in a sequence, when there is reason to presume a sequence to the variants on any one lemma.

*Status* Optional

*Datatype* `data.count`

*Note* Different variant sequences could be coded with distinct number trails: 1-2-3 for one sequence, 5-6-7 for another. More complex variant sequences, with (for example) multiple branchings from single readings, may be expressed through the <join> element.

**@hand** signifies the hand responsible for a particular reading in the witness.

*Status* Optional

*Datatype* `data.pointer`

*Values* must be one of the hand identifiers declared in the document header (see section 11.3.2.1. Document Hands).

*Note* This attribute is only available within an apparatus gathering variant readings in the transcription of an individual witness. It may not occur in an apparatus gathering readings from different witnesses.

*Note* This element class defines attributes inherited by <rdg>, <lem>, and <rdgGrp>.

---

**att.timed** provides attributes common to those elements which have a duration in time, expressed either absolutely or by reference to an alignment map. [8.3.5. *Temporal Information*]

*Module* tei — The TEI Infrastructure

*Members* binaryObject incident kinesic media pause u vocal writing

*Attributes* att.duration (att.duration.w3c (@dur)) (att.duration.iso (@dur-iso))

@start indicates the location within a temporal alignment at which this element begins.

*Status* Optional

*Datatype* data.pointer

*Note* If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchic level.

@end indicates the location within a temporal alignment at which this element ends.

*Status* Optional

*Datatype* data.pointer

*Note* If no value is supplied, the element is assumed to precede the immediately following element at the same hierarchic level.

---

**att.transcriptional** provides attributes specific to elements encoding authorial or scribal intervention in a text when transcribing manuscript or similar sources. [1. *The TEI Infrastructure*]

*Module* tei — The TEI Infrastructure

*Members* add addSpan del delSpan mod redo restore retrace subst substJoin undo

*Attributes* att.editLike (@evidence, @source, @instant) (att.dimensions (@unit, @quantity, @extent, @precision, @scope) (att.ranging (@atLeast, @atMost, @min, @max, @confidence))) (att.responsibility (@cert, @resp))

@hand signifies the hand of the agent which made the intervention.

*Status* Optional

*Datatype* data.pointer

*Values* must refer to a <handNote> element, typically declared in the document header (see section 11.3.2.1. *Document Hands*).

@status indicates the effect of the intervention, for example in the case of a deletion, strikeouts which include too much or too little text, or in the case of an addition, an insertion which duplicates some of the text already present.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **duplicate** all of the text indicated as an addition duplicates some text that is in the original, whether the duplication is word-for-word or less exact.

**duplicate-partial** part of the text indicated as an addition duplicates some text that is in the original

**excessStart** some text at the beginning of the deletion is marked as deleted even though it clearly should not be deleted.

**excessEnd** some text at the end of the deletion is marked as deleted even though it clearly should not be deleted.

**shortStart** some text at the beginning of the deletion is not marked as deleted even though it clearly should be.

**shortEnd** some text at the end of the deletion is not marked as deleted even though it clearly should be.

**partial** some text in the deletion is not marked as deleted even though it clearly should be.

**unremarkable** the deletion is not faulty.[Default]

*Note* Status information on each deletion is needed rather rarely except in critical editions from authorial manuscripts; status information on additions is even less common. Marking a deletion or addition as faulty is inescapably an interpretive act; the usual test applied in practice is the linguistic acceptability of the text with and without the letters or words in question.

@cause documents the presumed cause for the intervention.

*Status* Optional

*Datatype* `data.enumerated`

*Legal values are:* **fix** repeated for the purpose of fixation

**unclear** repeated to clarify a previously illegible or badly written text or mark

@seq (sequence) assigns a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred.

*Status* Mandatory when applicable

*Datatype* `data.count`

---

## att.translatable

provides attributes used to indicate the status of a translatable portion of an ODD document.

*Module* tei — The TEI Infrastructure

*Members* desc exemplum gloss remarks valDesc

*Attributes* Attributes

@versionDate specifies the date on which the source text was extracted and sent to the translator

*Status* Optional

*Datatype* `data.temporal.w3c`

*Note* The versionDate attribute can be used to determine whether a translation might need to be revisited, by comparing the modification date on the containing file with the versionDate value on the translation. If the file has changed, changelogs can be checked to see whether the source text has been modified since the translation was made.

---

## att.typed

provides attributes which can be used to classify or subclassify elements in any way. [1.3.1. Attribute Classes]

*Module* tei — The TEI Infrastructure

*Members* att.pointing.group[altGrp joinGrp linkGrp] ab accMat add addName addSpan alt altIdent altIdentifier am anchor application bibl biblStruct binaryObject bloc c camera cb change charProp cit cl climate collection colloc constraintSpec corr country custEvent damage damageSpan date decoNote del delSpan dim district div div1 div2 div3 div4 div5 div6 div7 eLeaf eTree event exemplum explicit figure filiation finalRubric floatingText forename g gb genName geogFeat geogName gloss gramGrp group head ident incident incipit join kinesic label lb lg line link listApp listBibl listEvent listNym listOrg listPerson listPlace listRelation location m mapping measureGrp media milestone mod moduleSpec msDesc msName name nameLink notatedMusic note nym offset org orgName origDate origPlace pause pb pc persName phr place placeName population provenance ptr quote re ref reg region relatedItem relationGrp restore rhyme roleName rs rubric s

seal seg settlement spGrp stamp state surface surfaceGrp surname term terrain text time trailer trait vocal w  
writing zone

#### Attributes Attributes

**@type** characterizes the element in some sense, using any convenient classification scheme or typology.

*Status* Optional

*Datatype* `data.enumerated`

```
<div
 type="verse">
 <head>Night in Tarras</head>
 <lg
 type="stanza">
 <l>At evening tramping on the hot white road</l>
 <l>...</l>
 </lg>
 <lg
 type="stanza">
 <l>A wind sprang up from nowhere as the sky</l>
 <l>...</l>
 </lg>
</div>
```

*Note* The type attribute is present on a number of elements, not all of which are members of att.typed, usually because these elements restrict the possible values for the attribute in a specific way.

**@subtype** provides a sub-categorization of the element, if needed

*Status* Optional

*Datatype* `data.enumerated`

*Note* The subtype attribute may be used to provide any sub-classification for the element additional to that provided by its type attribute.

*Schematron* `<sch:rule context="*[@subtype]"> <sch:assert test="@type">The <sch:name/> element should not be categorized in detail with @subtype unless also categorized in general with @type</sch:assert></sch:rule>`

*Note* When appropriate, values from an established typology should be used. Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the <valList> element in the project-specific schema description, as described in 23.3.1.4. *Modification of Attribute and Attribute Value Lists*.

**att.witnessed** supplies the attribute used to identify the witnesses supporting a particular reading in a critical apparatus. [12.1. The Apparatus Entry, Readings, and Witnesses]

*Module* textcrit — Critical Apparatus

*Members* lem rdg

#### Attributes Attributes

**@wit** (witness or witnesses) contains a list of one or more pointers indicating the witnesses which attest to a given reading.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* A space-delimited series of sigla; each sigil should correspond to a witness or witness group and occur as the value of the xml:id attribute on a <witness> element elsewhere in the document.

*Note* If the apparatus contains readings only for a single witness, this attribute may be consistently omitted. This attribute may occur both within an apparatus gathering variant readings in the transcription of an individual witness and within an apparatus gathering readings from different witnesses.

Additional descriptions or alternative versions of the sigla referenced may be supplied as the content of a child `<wit>` element.

## C Elements

**<ab>** (anonymous block) contains any arbitrary component-level unit of text, acting as an anonymous container for phrase or inter level elements analogous to, but without the semantic baggage of, a paragraph. [16.3. Blocks, Segments, and Anchors]

*Module* linking — Linking, Segmentation, and Alignment

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.typed (@type,

```

element ab
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.typed.attributes,
 att.declaring.attributes,
 att.fragmentable.attributes,
 macro.paraContent}

```

#### Example

```

<div type="book" n="Genesis">
 <div type="chapter" n="1">
 <ab>In the beginning God created the heaven and the earth.</ab>
 <ab>And the earth was without form, and void; and
 darkness was upon the face of the deep. And the
 spirit of God moved upon the face of the waters.</ab>
 <ab>And God said, Let there be light: and there was light.</ab>
 <!-- . . . -->
 </div>
</div>

```

*Note* The <ab> element may be used at the encoder's discretion to mark any component-level elements in a text for which no other more specific appropriate markup is defined.

---

**<abbr>** (abbreviation) contains an abbreviation of any sort. [3.5.5. *Abbreviations and Their Expansions*]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.responsibility (@cert,  
@resp) att.typed (type, @subtype)

@type allows the encoder to classify the abbreviation according to some convenient typology.

*Derived from* att.typed

*Status* Optional

*Datatype* data.enumerated

*Note* The type attribute is provided for the sake of those who wish to classify abbreviations at their point of occurrence; this may be useful in some circumstances, though usually the

same abbreviation will have the same type in all occurrences. As the sample values make clear, abbreviations may be classified by the method used to construct them, the method of writing them, or the referent of the term abbreviated; the typology used is up to the encoder and should be carefully planned to meet the needs of the expected use. For a typology of Middle English abbreviations, see Petty (1977)

```

### Example

```
The story I am
going to relate is true as to its main facts, and as to the
consequences <add place="above">of these facts</add> from which
this tale takes its title.
```

*Note* In a diplomatic edition attempting to represent an original source, the <add> element should not be used for additions to the current TEI electronic edition made by editors or encoders. In these cases, either the <corr> or <supplied> element are recommended. In a TEI edition of a historical text with previous editorial emendations in which such additions or reconstructions are considered part of the source text, the use of <add> may be appropriate, dependent on the editorial philosophy of the project.

**<additional>** groups additional information, combining bibliographic information about a manuscript, or surrogate copies of it with curatorial or administrative information. [10.9. *Additional information*]

*Module* msdescription — Manuscript Description

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

 attribute value { data.count }?,
 macro.phraseSeq.limited}

```

*Example*

```
<age value="2" notAfter="1986">under 20 in the early eighties</age>
```

*Note* As with other culturally-constructed traits such as sex, the way in which this concept is described in different cultural contexts may vary. The normalizing attributes are provided as a means of simplifying that variety to Western European norms and should not be used where that is inappropriate. The content of the element may be used to describe the intended concept in more detail, using plain text.

**<alt/>** (alternation) identifies an alternation or a set of choices among elements or passages. [16.8. Alternation]

*Module* linking — Linking, Segmentation, and Alignment

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.typed (@type,  
 @subtype) att.pointing (~~@target~~, @targetLang, @evaluate)

@target specifies the destination of the reference by supplying one or more URI References

*Derived from* att.pointing

*Status* Optional

*Datatype* 2–∞ occurrences of `data.pointer` separated by whitespace

*Values* One or more syntactically valid URI references, separated by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. TEI%20Consortium.

@targets specifies the identifiers of the alternative elements or passages.

*Deprecated* will be removed on 2013-09-20

*Status* Optional

*Datatype* 2–∞ occurrences of `data.pointer` separated by whitespace

*Values* Each value specified must be the same as that specified as value for an `xml:id` attribute for some other element in the current document.

*Note* This attribute is deprecated. It is retained for backward compatibility only; the attribute `target` should be used for preference. It is an error to supply both attributes, but one or the other must be present.

**@mode** states whether the alternations gathered in this collection are exclusive or inclusive.

*Status* Recommended

*Datatype* `data.enumerated`

*Legal values are:* **excl** (exclusive) indicates that the alternation is exclusive, i.e. that at most one of the alternatives occurs.

**incl** (inclusive) indicates that the alternation is not exclusive, i.e. that one or more of the alternatives occur.

**@weights** If mode is `excl`, each weight states the probability that the corresponding alternative occurs. If mode is `incl` each weight states the probability that the corresponding alternative occurs given that at least one of the other alternatives occurs.

*Status* Optional

*Datatype* 2–∞ occurrences of `data.probability` separated by whitespace

*Note* If mode is `excl`, the sum of weights must be 1. If mode is `incl`, the sum of weights must be in the range from 0 to the number of alternants.

<s>Help me find it.<ptr target="#A234"/>
</s>

```

**Note** On this element, the global xml:id attribute must be supplied to specify an identifier for the point at which this element occurs within a document. The value used may be chosen freely provided that it is unique within the document and is a syntactically valid name. There is no requirement for values containing numbers to be in sequence.

---

**<app>** (apparatus entry) contains one entry in a critical apparatus, with an optional lemma and usually one or more reading or a note on the relevant passage. [12.1.1. The Apparatus Entry]

Module textcrit — Critical Apparatus

**Attributes** att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
**@type** classifies the variation contained in this element according to some convenient typology.

**Status** Optional

**Datatype** data.enumerated

**@from** identifies the beginning of the lemma in the base text.

**Status** Optional

**Datatype** data.pointer

**Note** This attribute should be used when either the double-end point method of apparatus markup, or the location-referenced method with a URL rather than canonical reference, are used.

**@to** identifies the endpoint of the lemma in the base text.

**Status** Optional

**Datatype** data.pointer

**Note** This attribute is only used when the double-end point method of apparatus markup is used, when the encoded apparatus is not embedded *in-line* in the base-text.

**@loc** (location) indicates the location of the variation, when the location-referenced method of apparatus markup is used.

**Status** Optional

**Datatype** 1–∞ occurrences of data.word separated by whitespace

**Values** A string containing a canonical reference for the passage to which the variation applies.

*Note* This attribute is used only when the location-referenced encoding method is used.

```

<appInfo>
 <application version="1.5" ident="ImageMarkupTool1" notAfter="2006-06-01">
 <label>Image Markup Tool</label>
 <ptr target="#P1"/>
 <ptr target="#P2"/>
 </application>
</appInfo>

```

This example shows an appInfo element documenting the fact that version 1.5 of the Image Markup Tool1 application has an interest in two parts of a document which was last saved on June 6 2006. The parts concerned are accessible at the URLs given as target for the two <ptr> elements.

---

**<arc>** encodes an arc, the connection from one node to another in a graph. [19.1. *Graphs and Digraphs*]

*Module* nets — Graphs, Networks, and Trees

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@from gives the identifier of the node which is adjacent from this arc.

*Status* Required

*Datatype* data.pointer

*Values* The identifier of a node.

@to gives the identifier of the node which is adjacent to this arc.

*Status* Required

*Datatype* data.pointer

*Values* The identifier of a node.

*Member of*

*nets:* graph

*May contain*

*core:* label

*Declaration*

```

element arc
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute from { data.pointer },
 attribute to { data.pointer },
 (label, label?)?
}

```

*Example*

```

<arc from="#T3" to="#T3">
 <label>OLD</label>
 <label>VIEUX</label>
</arc>

```

*Note* The <arc> element must be used if the arcs are labeled. Otherwise, arcs can be encoded using the adj, adjTo and adjFrom attributes on the <node> tags in the graph. Both <arc> tags and adjacency attributes can be used, but the resulting encoding would be highly redundant. Zero, one, or two children <label> elements may be present. The first occurrence of <label> provides a label for the arc; the second provides a second label for the arc, and should be used if a transducer is being encoded.

---

### Example

<p>The TEI defines six <soCalled>global</soCalled> attributes; their names are  
 <att>xml:id</att>, <att>rend</att>, <att>xml:lang</att>, <att>n</att>, <att>xml:space</att>,  
 and <att>xml:base</att>; <att scheme="XX">style</att> is not among them.</p>

*Note* A namespace prefix may be used in order to specify the scheme as an alternative to specifying it via the  
 scheme attribute: it takes precedence

<attDef> (attribute definition) contains the definition of a single attribute. [22.4.5. Attribute List Specification]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.identified (@ident,  
 @predeclare, @module, @status) (att.combinable (@mode)) (att.deprecated (@validUntil)) )

@usage specifies the optionality of the attribute.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **req** (required)

**mwa** (mandatory when applicable )

**rec** (recommended )

**rwa** (recommended when applicable )

**opt** (optional ) [Default]

@ns (namespace) specifies the namespace to which this attribute belongs

*Status* Optional

*Datatype* data.namespace

*Default* http://www.tei-c.org/ns/1.0

*Members defined by*

*tagdocs:* attList

*May contain*

*core:* desc gloss

*tagdocs:* altIdent constraintSpec datatype defaultVal equiv exemplum remarks valDesc valList

*Declaration*

```

element attDef
{
 att.global.attributes,
 att.global.linking.attributes,

 <persName>John Fletcher</persName>
</author>
<author>
 <orgName key="BBC">British Broadcasting
 Corporation</orgName>: Radio 3 Network
</author>

```

*Note* Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use a generally recognized name authority file to supply the content for this element. The attributes key or ref may also be used to reference canonical information about the author(s) intended from any appropriate authority, such as a library catalogue or online resource. In the case of a broadcast, use this element for the name of the company or network responsible for making the broadcast.

Where an author is unknown or unspecified, this element may contain text such as *Unknown* or *Anonymous*.

When the appropriate TEI modules are in use, it may also contain detailed tagging of the names used for people, organizations or places, in particular where multiple names are given.

---

**<authority>** (release authority) supplies the name of a person or other agency responsible for making a work available, other than a publisher or distributor. [2.2.4. *Publication, Distribution, Licensing, etc.*]

**<biblScope>** (scope of bibliographic reference) defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work. [3.11.2.4. *Imprint, Size of a Document, and Reprint Information*]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@unit identifies the unit of information conveyed by the element, e.g. columns, pages, volume.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **volume** the element contains a volume number.

**issue** the element contains an issue number, or volume and issue numbers.

**page** the element contains a page number or page range.  
**line** the element contains a line number or line range.  
**chapter** the element contains a chapter indication (number and/or title)  
**part** the element identifies a part of a book or collection.  
**column** the element identifies a column.

**@type** identifies the type of information conveyed by the element, e.g. columns, pages, volume.

*Deprecated* will be removed on 2014-12-17

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **vol** (volume) the element contains a volume number.

**issue** the element contains an issue number, or volume and issue numbers.

**pp** (pages) the element contains a page number or page range.

**ll** (lines) the element contains a line number or line range.

**chap** (chapter) the element contains a chapter indication (number and/or title)

**part** the element identifies a part of a book or collection.

**@from** specifies the starting point of the range of units indicated by the unit attribute.

*Status* Optional

*Datatype* data.word

**@to** specifies the end-point of the range of units indicated by the unit attribute.

*Status* Optional

*Datatype* data.word

 </monogr>
</biblStruct>

```

**<bicond>** (bi-conditional feature-structure constraint) defines a biconditional feature-structure constraint; both consequent and antecedent are specified as feature structures or groups of feature structures; the constraint is satisfied if both subsume a given feature structure, or if both do not. [18.11. Feature System Declaration]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of*

*Contained by*

iso-fs: fsConstraints

*May contain*

iso-fs: f fs iff

*Declaration*

```

element bicond
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 ((fs | f), iff, (fs | f))
}

```

*Example*

```

<bicond>
 <fs>
 <f name="F00">
 <symbol value="42"/>
 </f>
 </fs>
 <iff/>
 <fs>
 <f name="BAR">
 <binary value="true"/>
 </f>
 </fs>
</bicond>

```

**<binary/>** (binary value) represents the value part of a feature-value specification which can contain either of exactly two possible values. [18.2. Elementary Feature Structures and the Binary Feature Value]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.datcat (@datcat,  
 @valueDatcat)

@value supplies a binary value.

*Status* Required

*Datatype* data.truthValue

*Values* a string representing a binary value (true or false, 0 or 1) .

*Member of* model.featureVal.single

Contained by

iso-fs: f fvLib if vAlt vColl vDefault vLabel vMerge vNot vRange

May contain Empty element

Declaration

```

element binary
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.datcat.attributes,
 attribute value { data.truthValue },
 empty
}

```

Example

```

<f name="strident">
 <binary value="true"/>
</f>
<f name="exclusive">
 <binary value="false"/>
</f>

```

*Note* The value attribute may take any value permitted for attributes of the W3C datatype Boolean: this includes for example the strings true or 1 which are equivalent.

---

**<binaryObject>** provides encoded binary data representing an inline graphic, audio, video or other object. [3.9. Graphics and Other Non-textual Components]

Module core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

```

**<binding>** contains a description of one binding, i.e. type of covering, boards, etc. applied to a manuscript. [10.7.3.1.  
*Binding Descriptions*]

*Module* msdescription — Manuscript Description

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.dataable (@calendar,  
@period) (att.dataable.w3c (@when, @notBefore, @notAfter, @from, @to)) (att.dataable.iso (@when-iso,

*@notBefore-iso, @notAfter-iso, @from-iso, @to-iso*) (*att.dataable.custom* (*@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod*))

*@contemporary* specifies whether or not the binding is contemporary with the majority of its contents

*Status* Optional

*Datatype* `data.xTruthValue`

*Note* The value `true` indicates that the binding is contemporaneous with its contents; the value `false` that it is not. The value `unknown` should be used when the date of either binding or manuscript is unknown

*Member of* `binding`

*msdescription:* `bindingDesc`

*May contain*

*core:* `p`

*linking:* `ab`

*msdescription:* `condition decoNote`

*Declaration*

```

element binding
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.dataable.attributes,
 att.dataable.w3c.attributes,
 att.dataable.iso.attributes,
 att.dataable.custom.attributes,
 attribute contemporary { data.xTruthValue }?,
 (model.pLike | condition | decoNote)+
}

```

*Example*

```

<binding contemporary="true">
 <p>Contemporary blind stamped leather over wooden boards with evidence of a fore edge clasp
 closing to the back cover.</p>
</binding>

```

*Example*

```

<bindingDesc>
 <binding contemporary="false">
 <p>Quarter bound by the Phillipps' binder, Bretherton, with his sticker on the front
 pastedown.</p>
 </binding>
 <binding contemporary="false">
 <p>Rebound by an unknown 19th c. company; edges cropped and gilt.</p>
 </binding>
</bindingDesc>

```

**<bindingDesc>** (binding description) describes the present and former bindings of a manuscript, either as a series of paragraphs or as a series of distinct <binding> elements, one for each binding of the manuscript. [10.7.3.1. *Binding Descriptions*]

*Module* msdescription — Manuscript Description

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of* model.physDescPart

*Contained by*

*msdescription:* physDesc

*May contain*

*core:* p

*msdescription:* binding condition decoNote

*Declaration*

```
element bindingDesc
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 ((model.pLike | decoNote | condition)+ | binding+)
}
```

*Example*

```
<bindingDesc>
 <p>Sewing not visible; tightly rebound over
 19th-cent. pasteboards, reusing panels of 16th-cent. brown leather with
 gilt tooling à la fanfare, Paris c. 1580-90, the centre of each
 cover inlaid with a 17th-cent. oval medallion of red morocco tooled in
 gilt (perhaps replacing the identifying mark of a previous owner); the
 spine similarly tooled, without raised bands or title-piece; coloured
 endbands; the edges of the leaves and boards gilt.Boxed.</p>
</bindingDesc>
```

**<birth>** (birth) contains information about a person's birth, such as its date and place. [15.2.2. *The Participant Description*]

*Module* namesdates — Names, Dates, People, and Places

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

*certainty:* certainty precision respons

*core:* cb gap gb head index lb milestone note pb

*drama:* castGroup castItem roleDesc

*figures:* figure notatedMusic

*iso-fs:* fLib fs fvLib

*linking:* alt altGrp anchor join joinGrp link linkGrp timeline

*spoken:* incident kinesic pause shift vocal writing

*textcrit:* witDetail

*textstructure:* trailer

*transcr:* addSpan damageSpan delSpan fw listTranspose metamark space substJoin

*Declaration*

```

element castGroup
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (
 (model.global | model.headLike)*,
 ((castItem | castGroup | roleDesc), model.global*)+,
 (trailer, model.global*)?
)
}

```

*Example*

```

<castGroup rend="braced">
 <castItem>
 <role>Walter</role>
 <actor>Mr Frank Hall</actor>
 </castItem>
 <castItem>
 <role>Hans</role>
 <actor>Mr F.W. Irish</actor>
 </castItem>
 <roleDesc>friends of Mathias</roleDesc>
</castGroup>

```

*Note* The rend attribute may be used, as here, to indicate whether the grouping is indicated by a brace, whitespace, font change, etc. Note that in this example the role description ‘friends of Mathias’ is understood to apply to both roles equally.

**<castItem>** (cast list item) contains a single entry within a cast list, describing either a single role or a list of non-speaking roles. [7.1.4. Cast Lists]

*Module* drama — Performance Texts

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type characterizes the cast item.

*Status* Optional

*Datatype* `data.enumerated`

*Legal values are:* **role** the item describes a single role. [Default]

**list** the item describes a list of non-speaking roles.

*Members defined by*

*drama:* castGroup castList

 }

```

*Example* Markup of an early English dictionary printed in two columns:

```

<pb/>
<cb n="1"/>
<entryFree>
 <form>Well</form>, <sense>a Pit to hold Spring-Water</sense>:
<sense>In the Art of <hi rend="italic">War</hi>, a Depth the Miner
 sinks into the Ground, to find out and disappoint the Enemies Mines,
 or to prepare one</sense>.
</entryFree>
<entryFree>To <form>Welter</form>, <sense>to wallow</sense>, or
<sense>lie groveling</sense>.</entryFree>
<!-- remainder of column -->
<cb n="2"/>
<entryFree>
 <form>Wey</form>, <sense>the greatest Measure for dry Things,
 containing five Chaldron</sense>.
</entryFree>
<entryFree>
 <form>Whale</form>, <sense>the greatest of
 Sea-Fishes</sense>.
</entryFree>

```

*Note* On this element, the global *n* attribute indicates the number or other value associated with the column which follows the point of insertion of this <cb> element. Encoders should adopt a clear and consistent policy as to whether the numbers associated with column breaks relate to the physical sequence number of the column in the whole text, or whether columns are numbered within the page. The <cb> element is placed at the head of the column to which it refers.

**<cell>** contains one cell of a table. [14.1.1. TEI Tables]

---

**<certainty>** indicates the degree of certainty associated with some aspect of the text markup. [21.1.2. *Structured Indications of Uncertainty*]

*Module* certainty — Certainty, Precision, and Responsibility

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.scoping (@target, @match)

@cert (certainty) signifies the degree of certainty associated with the object pointed to by the <certainty> element.

*Status* Optional

*Datatype* data.certainty

@locus indicates more exactly the aspect concerning which certainty is being expressed: specifically, whether the markup is correctly located, whether the correct element or attribute name has been used, or whether the content of the element or attribute is correct, etc.

*Status* Required

*Datatype* data.enumerated

*Legal values are:* **name** uncertainty concerns whether the name of the element or attribute used is correctly applied.

**start** uncertainty concerns whether the start of the element is correctly identified.

**end** uncertainty concerns whether the end of the element is correctly identified.

**location** uncertainty concerns both the start and the end of the element.

**value** uncertainty concerns the content (for an element) or the value (for an attribute)

@assertedValue provides an alternative value for the aspect of the markup in question—an alternative generic identifier, transcription, or attribute value, or the identifier of an <anchor> element (to indicate an alternative starting or ending location). If an assertedValue is given, the confidence level specified by degree applies to the alternative markup specified by assertedValue; if none is given, it applies to the markup in the text.

*Status* Recommended

*Datatype*

data.pointer | data.name | data.word

*Values* generic identifier, attribute value, location (e.g. indicated by a reference to an <anchor> element or to an <ptr> element), or other appropriate alternative value.

<certainty

target="#ESX"

locus="name"

assertedValue="placeName"

cert="low">

<desc>It is unlikely, but possible, that this refers to the place rather than the person.</desc>

</certainty>

<certainty

match="parent::tei:gap/@reason"

locus="value"

cert="low"/>

*Note* This attribute makes it possible to indicate the degree of confidence in a specific alternative to some aspect of the markup. In the example above the encoder is expressing the likelihood (.2) that the generic identifier should be <placeName> rather than <persName>, which is the coded element.

@given indicates conditions assumed in the assignment of a degree of confidence.

*Status* Recommended

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

*Values* one or more pointers to element(s) characterizing the conditions which are assumed in the assignment of a degree of confidence.

*Note* The envisioned typical value of this attribute would be the identifier of another <certainty> element or a list of such identifiers. It may thus be possible to construct probability networks by chaining <certainty> elements together. Such networks would

ultimately be grounded in unconditional <certainty> elements (with no value for given). The semantics of this chaining would be understood in this way: if a <certainty> element is specified, via a reference, as the assumption, then it is not the attribution of uncertainty that is the assumption, but rather the assertion itself. For instance, in the example above, the first <certainty> element indicates that the confidence in the identification of the new scribe as *msm*. The second indicates the degree of confidence that *Essex* is a personal name, given that the new scribe is *msm*. Note that the given in the second <certainty> element is not the assertion that the likelihood that *msm* is the new scribe is 0.6, but simply the assertion that *msm* is the new scribe; this is a recommended convention to facilitate building networks. The ambitious encoder may wish to attempt complex networks or probability assertions, experimenting with references to other elements or prose assertions, and deploying feature structure connectives such as <alt>, <join>, and <note>. However, we do not believe that the <certainty> element gives, at this time, a comprehensive ambiguity-free system for indicating certainty.

@degree indicates the degree of confidence assigned to the aspect of the markup named by the locus attribute.

Status Optional

**<charDecl>** (character declarations) provides information about nonstandard characters and glyphs. [5.2. Markup Constructs for Representation of Characters and Glyphs]

*Module* gaiji — Non-standard Characters and Glyphs

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of* model.encodingDescPart

*Contained by*

*header:* encodingDesc

*May contain*

*core:* desc

*gaiji:* char glyph

*Declaration*

```
element charDecl
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (desc?, (char | glyph)+)
}
```

*Example*

```
<charDecl>
 <char xml:id="aENL">
 <charName>LATIN LETTER ENLARGED SMALL A</charName>
 <mapping type="standard">a</mapping>
 </char>
</charDecl>
```

---

**<charName>** (character name) contains the name of a character, expressed following Unicode conventions. [5.2.

*Markup Constructs for Representation of Characters and Glyphs]*

*Module* gaiji — Non-standard Characters and Glyphs

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of*

*Contained by*

*gaiji:* char

*May contain* Character data only

*Declaration*

```
element charName
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 text
}
```

*Example*

```
<charName>CIRCLED IDEOGRAPH 4EBA</charName>
```

*Note* The name must follow Unicode conventions for character naming. Projects working in similar fields are recommended to coordinate and publish their list of <charName>s to facilitate data exchange.

**<charProp>** (character property) provides a name and value for some property of the parent character or glyph. [5.2. Markup Constructs for Representation of Characters and Glyphs]

*Module* gaiji — Non-standard Characters and Glyphs

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.typed (@type,  
 @subtype)

*Member of*

*Contained by*

*gaiji:* char glyph

*May contain*

*gaiji:* localName unicodeName value

*Declaration*

```
element charProp
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.typed.attributes,
 ((unicodeName | localName), value)
}
```

*Example*

```
<charProp>
 <unicodeName>character-decomposition-mapping</unicodeName>
 <value>circle</value>
</charProp>
<charProp>
 <localName>daikanwa</localName>
 <value>36</value>
</charProp>
```

*Note* If the property is a Unicode Normative Property, then its <unicodeName> must be supplied. Otherwise, its name must be specified by means of a <localName>. At a later release, additional constraints will be defined on possible value/name combinations using Schematron rules

**<choice>** groups a number of alternative encodings for the same point in a text. [3.4. Simple Editorial Changes]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

*Declaration*

```

element choice
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (model.choicePart | choice) *
}

```

*Example* An American encoding of *Gulliver's Travels* which retains the British spelling but also provides a version regularized to American spelling might be encoded as follows.

```

<p>Lastly, That, upon his solemn oath to observe all the above
articles, the said man-mountain shall have a daily allowance of
meat and drink sufficient for the support of <choice>
 <sic>1724</sic>
 <corr>1728</corr>
</choice> of our subjects,
with free access to our royal person, and other marks of our
<choice>
 <orig>favour</orig>
 <reg>favor</reg>
</choice>.</p>

```

*Note* Because the children of a <choice> element all represent alternative ways of encoding the same sequence, it is natural to think of them as mutually exclusive. However, there may be cases where a full representation of a text requires the alternative encodings to be considered as parallel. Note also that <choice> elements may self-nest.

Where the purpose of an encoding is to record multiple witnesses of a single work, rather than to identify multiple possible encoding decisions at a given point, the <app> element and associated elements discussed in section 12.1. *The Apparatus Entry, Readings, and Witnesses* should be preferred.

---

**<cit>** (cited quotation) contains a quotation from some other document, together with a bibliographic reference to its source. In a dictionary it may contain an example text with at least one occurrence of the word form, used in the sense being described, or a translation of the headword, or an example. [3.3.3. *Quotation* 4.3.1. *Grouped Texts* 9.3.5.1. *Examples*]

 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.pointing (@targetLang,  
 @target, @evaluate)

@unit identifies the type of information conveyed by the element, e.g. columns, pages, volume.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **volume** the element contains a volume number.

**issue** the element contains an issue number, or volume and issue numbers.

**page** the element contains a page number or page range.

**line** the element contains a line number or line range.

**chapter** the element contains a chapter indication (number and/or title)

**part** the element identifies a part of a book or collection.

**column** the element identifies a column.

@from specifies the starting point of the range of units indicated by the unit attribute.

*Status* Optional

*Datatype* data.word

@to specifies the end-point of the range of units indicated by the unit attribute.

*Note* The type attribute may be used to indicate the type of clause, taking values such as finite, nonfinite, declarative, interrogative, relative etc. as appropriate.

---

**<classCode>** (classification code) contains the classification code used for this text in some standard classification system. [2.4.3. *The Text Classification*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@scheme identifies the classification system or taxonomy in use.

*Status* Required

*Datatype* data.pointer

*Values* may point to a local definition, for example in a <taxonomy> element, or more usually to some external location where the scheme is fully defined.

*Members* defined by

*core:* imprint

*header:* textClass

*May contain*

*analysis:* interp interpGrp span spanGrp

 attribute scheme { data.pointer },
 macro.phraseSeq.limited}

```

*Example*

```
<classCode scheme="http://www.udc.org">410</classCode>
```

**<classDecl>** (classification declarations) contains one or more taxonomies defining any classificatory codes used elsewhere in the text. [2.3.7. *The Classification Declaration* 2.3. *The Encoding Description*]

*Module header* — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of* model.encodingDescPart

*Contained by*

*header:* encodingDesc

*May contain*

*header:* taxonomy

*Declaration*

```

element classDecl
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 taxonomy+
}

```

*Example*

```

<classDecl>
 <taxonomy xml:id="LCSH">
 <bibl>Library of Congress Subject Headings</bibl>
 </taxonomy>
</classDecl>
<!-- ... -->
<textClass>
 <keywords scheme="#LCSH">
 <term>Political science</term>

```

```
<term>United States -- Politics and government --
 Revolution, 1775-1783</term>
</keywords>
</textClass>
```

**<classes>** specifies all the classes of which the documented element or class is a member or subclass. [22.4.4. *Element Specifications* 22.4.6. *Element Classes*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@mode specifies the effect of this declaration on its parent module.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **change** this declaration changes the declaration of the same name in the current definition

**replace** this declaration replaces the declaration of the same name in the current definition[Default]

*Member of* defined by

*tagdocs:* classSpec elementSpec

*May contain*

*tagdocs:* memberOf

*Declaration*

```
element classes
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute mode { "change" | "replace" }?,
 (memberOf*)
}
```

*Example*

```
<classes>
 <memberOf key="model.qLike"/>
 <memberOf key="att.declarable"/>
</classes>
```

This <classes> element indicates that the element documented (which may be an element or a class) is a member of two distinct classes: model.qLike and att.declarable.

*Note* An empty <classes> element indicates that the element documented is not a member of any class. This should not generally happen.

**<classRef/>** points to the specification for an attribute or model class which is to be included in a schema [22.4.6. *Element Classes*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.readFrom (@source)  
 @key the identifier used for the required class within the source indicated.

*Status* Required

*Datatype* data.xmlName

*Member of* model.oddRef

*Contained by*

*tagdocs:* schemaSpec specGrp

*May contain* Empty element

*Declaration*

```

element classRef
{

 <classRef key="att.global.facs"/>
</schemaSpec>

```

*Note* Attribute and model classes are identified by the name supplied as value for the ident attribute on the <classSpec> element in which they are declared. All TEI names are unique; attribute class names conventionally begin with the letters att..

**<classSpec>** (class specification) contains reference information for a TEI element class; that is a group of elements which appear together in content models, or which share some common attribute, or both. [22.3. *Specification Elements* 22.4.6. *Element Classes*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.identified (@ident,  
@predeclare, @module, @status) (att.combinable (@mode) (att.deprecated (@validUntil)) )

@type indicates whether this is a model class or an attribute class

*Status* Required

*Datatype* data.enumerated

*Legal values are:* **model** (content model) members of this class appear in the same content models

**atts** (attributes) members of this class share common attributes

@generate indicates which alternation and sequence instantiations of a model class may be referenced.

By default, all variations are permitted.

*Status* Optional

*Datatype* 1–5 occurrences of data.enumerated separated by whitespace

*Legal values are:* **alternation** members of the class are alternatives

**sequence** members of the class are to be provided in sequence

**sequenceOptional** members of the class may be provided, in sequence, but are optional

**sequenceOptionalRepeatable** members of the class may be provided one or more times, in sequence, but are optional.

**sequenceRepeatable** members of the class may be provided one or more times, in sequence

*Member of* model.oddDecl

 <p>There are lacunae in three places in this
 manuscript. After 14v two
 leaves has been cut out and narrow strips leaves remains in the spine. After
 68v one gathering is missing and after 101v at least one gathering of 8 leaves
 has been lost. </p>
 <p>Several leaves are damaged with tears or holes or have a
 irregular shape. Some of the damages do not allow the lines to be of full
 length and they are apparently older than the script. There are tears on fol.
 2r-v, 9r-v, 10r-v, 15r-18v, 19r-v, 20r-22v, 23r-v, 24r-28v, 30r-v, 32r-35v,
 37r-v, 38r-v, 40r-43v, 45r-47v, 49r-v, 51r-v, 53r-60v, 67r-v, 68r-v, 70r-v,
 74r-80v, 82r-v, 86r-v, 88r-v, 89r-v, 95r-v, 97r-98v 99r-v, 100r-v. On fol. 98
 the corner has been torn off. Several leaves are in a bad condition due to
 moist and wear, and have become dark, bleached or
 wrinkled. </p>
 <p>The script has been
 touched up in the 17th century with black ink. The touching up on the following
 fols. was done by
 <name>Bishop Brynjólf Sveinsson</name>: 1v, 3r, 4r, 5r,
 6v, 8v,9r, 10r, 14r, 14v, 22r,30v, 36r-52v, 72v, 77r,78r,103r, 104r,. An
 AM-note says according to the lawman
 <name>Sigurður Björnsson</name> that the rest of the
 touching up was done by himself and another lawman
 <name>Sigurður Jónsson</name>.
 <name>Sigurður Björnsson</name> did the touching up
 on the following fols.: 46v, 47r, 48r, 49r-v, 50r, 52r-v.
 <name>Sigurður Jónsson</name> did the rest of the
 touching up in the section 36r-59r containing

```

```
<title>Bretasögur</title>
</p>
</condition>
```

**<constitution>** describes the internal composition of a text or text sample, for example as fragmentary, complete, etc. [15.2.1. *The Text Description*]

*Module* corpus — Language Corpora

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type specifies how the text was constituted.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **single** a single complete text [Default]

**composite** a text made by combining several smaller items, each individually complete

**frags** (fragments) a text made by combining several smaller, not necessarily complete, items

**unknown** composition unknown or unspecified

*Member of* model.textDescPart

*Contained by*

*corpus:* textDesc

*May contain*

*analysis:* interp interpGrp span spanGrp

*certainty:* certainty precision respons

*core:* abbr address cb choice date distinct email emph expan foreign gap gb gloss hi index lb measure measureGrp  
 mentioned milestone name note num pb ptr ref rs soCalled term time title

*Declaration*

```
element constitution
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
```

```

att.global.facs.attributes,
att.global.change.attributes,
attribute type { "single" | "composite" | "frags" | "unknown" }?,
macro.phraseSeq.limited}

```

*Example*

```
<constitution type="frags">Prologues only.</constitution>
```

*Note* The function of this element seems to overlap with both the org attribute on <div> and the <samplingDecl> in the <encodingDesc>.

## <constraint> (constraint rules) the formal rules of a constraint [22.4.4. *Element Specifications*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of*

*Contained by*

*tagdocs:* constraintSpec

*May contain* ANY

*Declaration*

```

element constraint
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (text | macro.anyXML)
}

```

*Example*

```

<constraintSpec ident="local" scheme="private">
 <constraint>
 (output = (ident(title) ident(author) "You must supply a title or an author"))
 </constraint>
</constraintSpec>

```

## <constraintSpec> (constraint on schema) contains a constraint, expressed in some formal syntax, which cannot be expressed in the structural content model [22.4.4. *Element Specifications*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.identified (@ident,  
 @predeclare, @module, @status) (att.combinable (@mode) (att.deprecated (@validUntil)) ) att.typed (@type,  
 @subtype)  
 @scheme supplies the name of the language in which the constraints are defined

*Status* Required

*Datatype* `data.enumerated`

*Legal values are:* **schematron** (Schematron)

**isoschematron** (ISO Schematron)

**xsl** (XSLT)

**private** (private constraint language)

*Members defined by*

*tagdocs:* attDef classSpec elementSpec macroSpec schemaSpec

*May contain*

*core:* desc gloss

*tagdocs:* altIdent constraint equiv

*Declaration*

```

element constraintSpec
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.identified.attributes,
 att.combinable.attributes,
 att.deprecated.attributes,
 att.typed.attributes,
 attribute scheme { "schematron" | "isoschematron" | "xsl" | "private" },
 model.descLike*,
 model.glossLike*,
 constraint?
}

```

*Schematron* Relationship between scheme attribute and

contents<sch:ns prefix="s" uri="http://www.ascc.net/xml/schematron"/> <sch:report test="tei:constraint/s:\* and not(@scheme='schematron')">Rules in the Schematron 1.\* language must be inside a constraint with a value of 'schematron' on the scheme attribute </sch:report>

*Schematron* <sch:ns prefix="sch" uri="http://purl.oclc.org/dsdl/schematron"/> <sch:report test="tei:constraint/sch:\* and not(@scheme='isoschematron')">Rules in the ISO Schematron language must be inside a constraint with a value of 'isoschematron' on the scheme attribute </sch:report>

*Example* This constraint uses Schematron to enforce the presence of the spanTo attribute (which comes from an attribute class) on the <addSpan> element:

```

<constraintSpec ident="demo-c1" scheme="isoschematron"
 xmlns:sch="http://purl.oclc.org/dsdl/schematron">
 <desc>Enforce the presence of the <att>spanTo</att> attribute</desc>
 <constraint>
 <sch:assert test="@spanTo">The spanTo= attribute of <sch:name/>
 is required.</sch:assert>
 </constraint>
</constraintSpec>

```

*Example*

```

<constraintSpec ident="demo-c2" scheme="isoschematron"
 xmlns:sch="http://purl.oclc.org/dsdl/schematron">

```

```

<desc>Implement an accessibility rule which says that pictures should
 have textual explanations</desc>
<constraint>
 <sch:report test="not(tei:figDesc or tei:head)"> You should
 provide information in a figure from which
 we can construct an alt attribute in HTML </sch:report>
</constraint>
</constraintSpec>

```

*Example* This constraint uses a language which is not expressed in XML to check whether the title and author are identical:

```

<constraintSpec ident="local" scheme="private">
 <constraint>
 (output = leq(title,author) "title and author cannot be the same")
 </constraint>
</constraintSpec>

```

**<content>** (content model) contains the text of a declaration for the schema documented. [22.4.4. *Element Specifications*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@autoPrefix controls whether or not pattern names generated in the corresponding RELAXNG schema source are automatically prefixed to avoid potential nameclashes.

*Status* Optional

*Datatype* data.truthValue

*Legal values are:* **true** Each name referenced in e.g. a <rng:ref> element within a content model is automatically prefixed by the value of the prefix attribute on the current <schemaSpec>[Default]

**false** No prefixes are added: any prefix required by the value of the prefix attribute on the current <schemaSpec> must therefore be supplied explicitly, as appropriate.

*Members defined by*

*tagdocs:* elementSpec macroSpec moduleRef

*May contain* Empty element

*Declaration*

```

element content
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute autoPrefix { "true" | "false" }?,
 macro.schemaPattern*
}

```

*Example* This content model allows either a sequence of paragraphs or a series of msItem elements optionally preceded by a summary:

```

<content>
 <rng:choice>
 <rng:oneOrMore>
 <rng:ref name="model.pLike"/>
 </rng:oneOrMore>
 <rng:group>
 <rng:optional>
 <rng:ref name="summary"/>
 </rng:optional>
 <rng:oneOrMore>
 <rng:ref name="msItem"/>
 </rng:oneOrMore>
 </rng:group>
 </rng:choice>
</content>

```

*Note* As the example shows, content models may be expressed using the RELAX NG syntax directly. To avoid ambiguity when schemas using elements from different namespaces are created, the name supplied for an element in a content model will be automatically prefixed by a short string, as specified by the prefix attribute on <schemaSpec>. The autoPrefix attribute may be used to reverse this behaviour. The macro `macro.schemaPattern` defines which elements may be used to define content models. Alternatively, a content model may be expressed using the TEI <valList> element.

---

**<corr>** (correction) contains the correct form of a passage apparently erroneous in the copy text. [3.4.1. *Apparent Errors*]

*Module* core — Elements Available in All TEI Documents

```

*Example* If all that is desired is to call attention to the fact that the copy text has been corrected, <corr> may be used alone:

I don't know,  
 Juan. It's so far in the past now – how <corr>can we</corr> prove  
 or disprove anyone's theories?

*Example* It is also possible, using the <choice> and <sic> elements, to provide an uncorrected reading:

I don't know, Juan. It's so far in the past now –  
 how <choice>  
   <sic>we can</sic>  
   <corr>can we</corr>  
</choice> prove or  
 disprove anyone's theories?

**<correction>** (correction principles) states how and under what circumstances corrections have been made in the text. [2.3.3. *The Editorial Practices Declaration* 15.3.2. *Declarable Elements*]

*Module* header – The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.declarable (@default)

@status indicates the degree of correction applied to the text.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **high** the text has been thoroughly checked and proofread.

**medium** the text has been checked at least once.

**low** the text has not been checked.

**unknown** the correction status of the text is unknown. [Default]

@method indicates the method adopted to indicate corrections within the text.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **silent** corrections have been made silently [Default]

**markup** corrections have been represented using markup

*Member of* model.editorialDeclPart

</creation>

```

*Example*

```

<creation>
 <date when="1988-07-10">10 July 1988</date>
</creation>

```

*Note* The <creation> element may be used to record details of a text's creation, e.g. the date and place it was composed, if these are of interest. It may also contain a more structured account of the various stages or revisions associated with the evolution of a text; this should be encoded using the <listChange> element. It should not be confused with the <publicationStmt> element, which records date and place of publication.

---

**<cRefPattern>** (canonical reference pattern) specifies an expression and replacement pattern for transforming a canonical reference into a URI. [2.3.6.3. *Milestone Method* 2.3.6. *The Reference System Declaration* 2.3.6.2. *Search-and-Replace Method*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.patternReplacement  
(@matchPattern, @replacementPattern)

*Member of*

*Contained by*

*header:* refsDecl

*May contain*

*core:* p

*linking:* ab

*Declaration*

```
element cRefPattern
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.patternReplacement.attributes,
 model.pLike*
}
```

*Example*

```
<cRefPattern
 matchPattern="([1-9A-Za-z]+\s+([0-9]+):([0-9]+)"
 replacementPattern="#xpath(//div[@type='book'][@n='$1']/div[@type='chap'][@n='$2']/div[@type='verse'][@n='$3'])"/>
```

*Note* The result of the substitution may be either an absolute or a relative URI reference. In the latter case it is combined with the value of xml:base in force at the place where the cRef attribute occurs to form an absolute URI in the usual manner as prescribed by XML Base.

---

**<custEvent>** (custodial event) describes a single event during the custodial history of a manuscript. [10.9.1.2. *Availability and Custodial History*]

*Module* msdescription — Manuscript Description

```

<l>The Moving Finger wri<damage agent="water" group="1">es; and</damage> having writ,</l>
<l>Moves <damage agent="water" group="1">
 <supplied>on: nor all your</supplied>
</damage> Piety nor Wit</l>

```

*Note* Since damage to text witnesses frequently makes them harder to read, the <damage> element will often contain an <unclear> element. If the damaged area is not continuous (e.g. a stain affecting several strings of text), the group attribute may be used to group together several related <damage> elements; alternatively the <join> element may be used to indicate which <damage> and <unclear> elements are part of the same physical phenomenon. The <damage>, <gap>, <del>, <unclear> and <supplied> elements may be closely allied in use. See section 11.3.3.2. *Use of the <gap>, <del>, <damage>, <unclear>, and <supplied> Elements in Combination* for discussion of which element is appropriate for which circumstance.

**<damageSpan/>** (damaged span of text) marks the beginning of a longer sequence of text which is damaged in some way but still legible. [11.3.3.1. *Damage, Illegibility, and Supplied Text*]

*Module* transcr — Representation of Primary Sources

}

```

*Schematron* <s:assert test="@spanTo">The @spanTo attribute of <s:name/> is required.</s:assert>

*Schematron* <s:assert test="@spanTo">L'attribut spanTo est requis.</s:assert>

*Example*

```

<p>Paragraph partially damaged. This is the undamaged
portion <damageSpan spanTo="#a34"/>and this the damaged
portion of the paragraph.</p>
<p>This paragraph is entirely damaged.</p>
<p>Paragraph partially damaged; in the middle of this
paragraph the damage ends and the anchor point marks
the start of the <anchor xml:id="a34"/> undamaged part of the text. ...</p>

```

*Note* Both the beginning and ending of the damaged sequence must be marked: the beginning by the <damageSpan> element, the ending by the target of the spanTo attribute: if no other element available, the <anchor> element may be used for this purpose. The damaged text must be at least partially legible, in order

for the encoder to be able to transcribe it. If it is not legible at all, the <damageSpan> element should not be used. Rather, the <gap> or <unclear> element should be employed, with the value of the reason attribute giving the cause. See further sections 11.3.3.1. *Damage, Illegibility, and Supplied Text* and 11.3.3.2. *Use of the <gap>, <del>, <damage>, <unclear>, and <supplied> Elements in Combination*.

**<datatype>** specifies the declared value for an attribute, by referring to any datatype defined by the chosen schema language. [1.4.2. *Datatype Macros* 22.4.5. *Attribute List Specification*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@minOccurs (minimum number of occurrences) indicates the minimum number of times this datatype may occur in the specification of the attribute being defined

*Status* Optional

*Datatype* data.count

*Default* 1

@maxOccurs (maximum number of occurrences) indicates the maximum number of times this datatype may occur in the specification of the attribute being defined

*Status* Optional

*Datatype* data.count | "unbounded"

*Default* 1

*Members defined by*

*tagdocs:* attDef

*May contain* Empty element

*Declaration*

```
element datatype
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute minOccurs { data.count }?,
 attribute maxOccurs { data.count | "unbounded" }?,
 macro.schemaPattern*
}
```

*Example*

```
<datatype>
 <rng:data type="token"/>
</datatype>
```

*Example*

```
<datatype>
 <rng:ref name="data.enumerated"/>
</datatype>
```

*Example* The encoding in the following example requires that the attribute being defined contain at least two URIs in its value, as is the case for the targets attribute of <join>.

```
<datatype minOccurs="2" maxOccurs="unbounded">
 <rng:ref name="data.pointer"/>
</datatype>
```

*Note* In the TEI scheme, most datatypes are expressed using pre-defined TEI macros, which map a name in the form data.xxxx to a RelaxNG or WSD defined datatype.

```

**Note** Degrees of uncertainty over what can still be read, or whether a deletion was intended may be indicated by use of the <certainty> element (see 21. *Certainty, Precision, and Responsibility*). This element should be used for deletion of shorter sequences of text, typically single words or phrases. The <delSpan> element should be used for longer sequences of text, for those containing structural subdivisions, and for those containing overlapping additions and deletions.

The text deleted must be at least partially legible in order for the encoder to be able to transcribe it (unless it is restored in a <supplied> tag). Illegible or lost text within a deletion may be marked using the <gap> tag to

signal that text is present but has not been transcribed, or is no longer visible. Attributes on the <gap> element may be used to indicate how much text is omitted, the reason for omitting it, etc. If text is not fully legible, the <unclear> element (available when using the additional tagset for transcription of primary sources) should be used to signal the areas of text which cannot be read with confidence in a similar way. There is a clear distinction in the TEI between <del>, which is a statement of the the or a later scribe's intent to cancel or remove text, and elements such as <gap> or <unclear> which signal the editor's decision to omit or inability to read the text remaining. See further sections 11.3.1.7. *Text Omitted from or Supplied in the Transcription* and, for the close association of the <del> tag with the <gap>, <damage>, <unclear> and <supplied> elements (the latter three tags available when using the additional tagset for transcription of primary sources), 11.3.3.2. *Use of the <gap>, <del>, <damage>, <unclear>, and <supplied> Elements in Combination*.  
The <del> tag should not be used for deletions made by editors or encoders. In these cases, either <corr>, <surplus> or <gap> should be used.

---

**<delSpan/>** (deleted span of text) marks the beginning of a longer sequence of text deleted, marked as deleted, or otherwise signaled as superfluous or spurious by an author, scribe, annotator, or corrector. [11.3.1.4. *Additions and Deletions*]

*Schematron* <s:assert test="@spanTo">The spanTo= attribute of <s:name/> is required.</s:assert>

*Schematron* <s:assert test="@spanTo">L'attribut spanTo est requis.</s:assert>

*Example*

```

<p>Paragraph partially deleted. This is the undeleted
portion <delSpan spanTo="#a23"/>and this the deleted
portion of the paragraph.</p>
<p>Paragraph deleted together with adjacent material.</p>
<p>Second fully deleted paragraph.</p>
<p>Paragraph partially deleted; in the middle of this
paragraph the deletion ends and the anchor point marks
the resumption <anchor xml:id="a23"/> of the text. ...</p>

```

*Note* Both the beginning and ending of the deleted sequence must be marked: the beginning by the <delSpan> element, the ending by the target of the spanTo attribute. The text deleted must be at least partially legible, in order for the encoder to be able to transcribe it. If it is not legible at all, the <delSpan> tag should not be used. Rather, the <gap> tag should be employed to signal that text cannot be transcribed, with the value of the reason attribute giving the cause for the omission from the transcription as deletion. If it is not fully legible, the <unclear> element should be used to signal the areas of text which cannot be read with confidence. See further sections 11.3.1.7. *Text Omitted from or Supplied in the Transcription* and, for the close association of the <delSpan> tag with the <gap>, <damage>, <unclear> and <supplied> elements, 11.3.3.2. *Use of the <gap>, <del>, <damage>, <unclear>, and <supplied> Elements in Combination*. The <delSpan> tag should not be used for deletions made by editors or encoders. In these cases, either the <corr> tag or the <gap> tag should be used.

#### Declaration

```

element dictScrap
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (
 text
 | model.gLike | model.entryPart | model.morphLike | model.phrase | model.inter | model.global
)
}

```

#### Example

```

<entry>
 <dictScrap>
 <orth>biryani</orth> or <orth>biriani</orth>
 <pron>(%bIrI"A:nI)</pron>
 <def>any of a variety of Indian dishes ...</def>
 <etym>[from <lang>Urdu</lang>]</etym>
 </dictScrap>
</entry>

```

*Note* May contain any dictionary elements in any combination. This element is used to mark part of a dictionary entry in which lower level dictionary elements appear, but which does not itself form an identifiable structural unit.

---

**<dim>** contains any single measurement forming part of a dimensional specification of some sort. [10.3.4. Dimensions]

 att.ranging.attributes,
 macro.xtext}

```

*Example*

```
<dim type="circumference" extent="4.67 in"/>
```

*Note* The specific elements <width>, <height>, and <depth> should be used in preference to this generic element wherever appropriate.

## <dimensions> contains a dimensional specification. [10.3.4. Dimensions]

*Module* msdescription — Manuscript Description

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.dimensions (@unit,  
 @quantity, @extent, @precision, @scope) (att.ranging (@atLeast, @atMost, @min, @max, @confidence))

@type indicates which aspect of the object is being measured.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **leaves** dimensions relate to one or more leaves (e.g. a single leaf, a gathering, or a separately bound part)

**ruled** dimensions relate to the area of a leaf which has been ruled in preparation for writing.

**pricked** dimensions relate to the area of a leaf which has been pricked out in preparation for ruling (used where this differs significantly from the ruled area, or where the ruling is not measurable).

**written** dimensions relate to the area of a leaf which has been written, with the height measured from the top of the minims on the top line of writing, to the bottom of the minims on the bottom line of writing.

**miniatures** dimensions relate to the miniatures within the manuscript

**binding** dimensions relate to the binding in which the codex or manuscript is contained

**box** dimensions relate to the box or other container in which the manuscript is stored.

titlePart trailer

*transcr:* damage fw metamark mod restore retrace supplied surplus

*verse:* metSym rhyme

*May contain*

*msdescription:* depth dim height width

*Declaration*

```

element dimensions
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.dimensions.attributes,
 att.ranging.attributes,
 attribute type { data.enumerated }?,
 ((dim | model.dimLike) *)
}

```

*Schematron* <s:report test="count(tei:width)> 1">The element <s:name/> may appear once only </s:report>

<s:report test="count(tei:height)> 1">The element <s:name/> may appear once only </s:report>

<s:report test="count(tei:depth)> 1">The element <s:name/> may appear once only </s:report>

*Example*

```

<dimensions type="leaves">
 <height scope="range">157-160</height>
 <width>105</width>
</dimensions>
<dimensions type="ruled">
 <height scope="most">90</height>
 <width scope="most">48</width>
</dimensions>
<dimensions unit="in">
 <height>12</height>
 <width>10</width>
</dimensions>

```

*Example* This element may be used to record the dimensions of any text-bearing object, not necessarily a codex.  
For example:

```

<dimensions type="panels">
 <height scope="all">7004</height>
 <width scope="all">1803</width>
 <dim type="relief" unit="mm">345</dim>
</dimensions>

```

This might be used to show that the inscribed panels on some (imaginary) monument are all the same size (7004 by 1803 cm) and stand out from the rest of the monument by 345 mm.

*Example* When simple numeric quantities are involved, they may be expressed on the quantity attribute of any or all of the child elements, as in the following example:

```
<dimensions type="leaves">
 <height scope="range">157-160</height>
 <width quantity="105"/>
</dimensions>
<dimensions type="ruled">
 <height unit="cm" scope="most" quantity="90"/>
 <width unit="cm" scope="most" quantity="48"/>
</dimensions>
<dimensions unit="in">
 <height quantity="12"/>
 <width quantity="10"/>
</dimensions>
```

*Note* Contains no more than one of each of the specialized elements used to express a three-dimensional object's height, width, and depth, combined with any number of other kinds of dimensional specification.

---

**<distinct>** identifies any word or phrase which is regarded as linguistically distinct, for example as archaic, technical, dialectal, non-preferred, etc., or as forming part of a sublanguage. [3.3.2.3. *Other Linguistically Distinct Material*]

*Module* core — Elements Available in All TEI Documents

</div5>
</div4>
</div3>
</div2>

```

*Note* any sequence of low-level structural elements, e.g., paragraphs (<p>), lists (<list>), or examples (<eg> or <egXML>).

**<divGen>** (automatically generated text division) indicates the location at which a textual division generated automatically by a text-processing application is to appear. [3.8.2. *Index Entries*]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type specifies what type of generated text division (e.g. index, table of contents, etc.) is to appear.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **index** an index is to be generated and inserted at this point.

**toc** a table of contents

**figlist** a list of figures

**tablist** a list of tables

*Note* Valid values are application-dependent; those shown are of obvious utility in document production, but are by no means exhaustive.

*Member of* model.divGenLike model.frontPart

*Contained by*

*textstructure:* back body div div1 div2 div3 div4 div5 div6 front

*May contain*

*core:* head

*Declaration*

```

element divGen
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute type { data.enumerated }?,
 model.headLike*
}

```

*Example* One use for this element is to allow document preparation software to generate an index and insert it in the appropriate place in the output. The example below assumes that the `indexName` attribute on `<index>` elements in the text has been used to specify index entries for the two generated indexes, named NAMES and THINGS:

```
<back>
 <div1 type="backmat">
 <head>Bibliography</head>
 <!-- -->
</div1>
<div1 type="backmat">
 <head>Indices</head>
 <divGen n="Index Nominum" type="NAMES"/>
 <divGen n="Index Rerum" type="THINGS"/>
</div1>
</back>
```

*Example* Another use for `<divGen>` is to specify the location of an automatically produced table of contents:

```
<front>
<!--<titlePage>...</titlePage>-->
 <divGen type="toc"/>
 <div>
 <head>Preface</head>
 <p> ... </p>
 </div>
</front>
```

*Note* This element is intended primarily for use in document production or manipulation, rather than in the transcription of pre-existing materials; it makes it easier to specify the location of indices, tables of contents, etc., to be generated by text preparation or word processing software.

---

**<docAuthor>** (document author) contains the name of the author of the document, as given on the title page (often but not always contained in a byline). [4.6. *Title Pages*]

element docAuthor
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.canonical.attributes,
 macro.phraseSeq}

```

*Example*

```

<titlePage>
 <docTitle>
 <titlePart>Travels into Several Remote Nations of the World, in Four
 Parts.</titlePart>
 </docTitle>
 <byline> By <docAuthor>Lemuel Gulliver</docAuthor>, First a Surgeon,
 and then a Captain of several Ships</byline>
</titlePage>

```

*Note* The document author's name often occurs within a byline, but the <docAuthor> element may be used whether the <byline> element is used or not.

**<docDate>** (document date) contains the date of a document, as given (usually) on a title page. [4.6. *Title Pages*]

*Module* textstructure — Default Text Structure

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@when gives the value of the date in standard form, i.e. YYYY-MM-DD.

*Status* Optional

*Datatype* data.temporal.w3c

*Values* a date in one of the formats specified in *XML Schema Part 2: Datatypes Second Edition*

*Note* For simple dates, the when attribute should give the Gregorian or proleptic Gregorian date in the form (YYYY-MM-DD) specified by *XML Schema Part 2*.

 }

```

*Example*

```
<docImprint>Oxford, Clarendon Press, 1987</docImprint>
```

Imprints may be somewhat more complex:

```

<docImprint>
 <pubPlace>London</pubPlace>
 Printed for <name>E. Nutt</name>,
 at
 <pubPlace>Royal Exchange</pubPlace>;
 <name>J. Roberts</name> in
 <pubPlace>wick-Lane</pubPlace>;
 <name>A. Dodd</name> without
 <pubPlace>Temple-Bar</pubPlace>;
 and <name>J. Graves</name> in
 <pubPlace>St. James's-street.</pubPlace>
 <date>1722.</date>
</docImprint>

```

*Note* Cf. the <imprint> element of bibliographic citations. As with title, author, and editions, the shorter name is reserved for the element likely to be used more often.

---

**<docTitle>** (document title) contains the title of a document, including all its constituents, as given on a title page.  
[4.6. Title Pages]

 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 macro.phraseSeq}

```

### Example

```

<p>The
<gi>term</gi> element is declared using the following syntax:
<eg><![CDATA[<ELEMENT term (%phrase.content;)>]]</eg>
</p>

```

**Note** If the example contains material in XML markup, either it must be enclosed within a CDATA marked section, or character entity references must be used to represent the markup delimiters. If the example contains well-formed XML, it should be marked using the more specific <egXML> element.

**<egXML>** (example of XML) contains a single well-formed XML fragment demonstrating the use of some XML element or attribute, in which the <egXML> element itself functions as the root element. [22.1.1. *Phrase Level Terms*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.source (@source)  
@valid indicates the intended validity of the example with respect to a schema.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **true** the example is intended to be fully valid, assuming that its root element, or a provided root element, could have been used as a possible root element in the schema concerned.[Default]

**feasible** the example could be transformed into a valid document by inserting any number of valid attributes and child elements anywhere within it; or it is valid against a version of the schema concerned in which the provision of character data, list, element, or attribute values has been made optional.

**false** the example is not intended to be valid, and contains deliberate errors.

*May contain* ANY

*Declaration*

```
element egXML
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.source.attributes,
 attribute valid { "true" | "feasible" | "false" }?,
 text | macro.anyXML*
}
```

*Example*

```

<egXML xmlns="http://www.tei-c.org/ns/Examples">
 <div>
 <head>A slide about <gi>egXML</gi></head>
 <list>
 <item><gi>egXML</gi> can be used to give XML examples in the TEI
 Examples namespace</item>
 <item>Attributes values for <att>valid</att>:
 <list rend="collapsed">
 <item><val rend="green">true</val>: intended to be fully
 valid</item>
 <item><val rend="amber">feasible</val>: valid if missing nodes
 provided</item>
 <item><val rend="red">>false</val>: not intended to be valid</item>
 </list>
 </item>
 <item>The<att>rend</att> attribute in the TEI namespace can be
 used for recording how parts of the example was rendered.</item>
 </list>
</div>
</egXML>

```

*Example*

```

<egXML xmlns="http://www.tei-c.org/ns/Examples" valid="feasible">
 <text>
 <front><!-- front matter for the whole group --></front>
 <group>
 <text>
 <!-- first text -->
 </text>
 <text>
 <!-- second text -->
 </text>
 </group>
 </text>
 <!-- This example is not valid TEI, but could be made so by
 adding missing components -->

```

*Example*

```

<egXML xmlns="http://www.tei-c.org/ns/Examples" valid="false">
 <para xml:lang="en">Doubloons are a pirate's best friend</para>
</egXML>
<!-- This example is not TEI at all -->

```

*Note* In the source of the TEI Guidelines, this element declares itself and its content as belonging to the namespace <http://www.tei-c.org/ns/Examples>. This enables the content of the element to be validated independently against the TEI scheme. Where this element is used outside this context, a different namespace or none at all may be preferable. The content must however be a well-formed XML fragment or document: where this is not the case, the more general <eg> element should be used in preference. In a TEI context use of the `rend`

attribute in the TEI namespace, as opposed to the TEI Examples namespace, enables recording of rendition information.

---

**<eLeaf>** (leaf or terminal node of an embedding tree) provides explicitly for a leaf of an embedding tree, which may also be encoded with the eTree element. [19.3. Another Tree Notation]

*Module* nets — Graphs, Networks, and Trees

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.typed (@type,  
 @subtype)  
 @value provides the value of an embedding leaf, which is a feature structure or other analytic element.

*Status* Optional

*Datatype* data.pointer

*Values* A valid identifier of a feature structure or other analytic element.

*Members defined by*

*nets:* eTree triangle

*May contain*

*core:* label ptr ref

*Declaration*

```

element eLeaf
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.typed.attributes,
 attribute value { data.pointer }?,
 (label?, model.ptrLike?)
}

```

*Example*

```

<eLeaf value="http://an.fsurl.tei/#FSWITH">
 <label>with</label>
</eLeaf>

```

*Note* The <eTree> tag may be used if the encoder does not wish to distinguish by name between nonleaf and leaf nodes in embedding trees; they are distinguished by their arrangement.

---

**<elementRef/>** points to the specification for some element which is to be included in a schema [22.2. Modules and Schemas]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.readFrom (@source)  
 @key the identifier used for the required element within the source indicated.

*Status* Required

Datatype data.xmlName

Member of model.oddRef

Contained by

tagdocs: schemaSpec specGrp

May contain Empty element

Declaration

```

element elementRef
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.readFrom.attributes,
 attribute key { data.xmlName },
 empty
}

```

Example

```
<elementRef key="p"/>
```

Include in the schema an element named <p> available from the current default source.

Example

```
<elementRef key="p" source="tei:1.2.1"/>
```

Include in the schema an element named <p> available from the TEI P5 1.2.1 release.

*Note* Elements are identified by the name supplied as value for the ident attribute on the <elementSpec> element in which they are declared. TEI element names are unique.

---

**<elementSpec>** (element specification) documents the structure, content, and purpose of a single element type.  
 [22.4.4. *Element Specifications* 22. *Documentation Elements*]

Module tagdocs — Documentation Elements

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.identified (@ident,  
 @predeclare, @module, @status) (att.combinable (@mode) (att.deprecated (@validUntil)) ) att.namespaceable  
 (@ns)

@prefix specifies a default prefix which will be prepended to all patterns relating to the element, unless otherwise stated.

Status Optional

Datatype " " | data.name

*Note* Colons, although permitted inside the value, will cause an invalid schema to be generated.

 att.global.change.attributes,
 att.entryLike.attributes,

```

```

 att.sortable.attributes,
 (hom | sense | model.entryPart.top | model.global | model.ptrLike)+
 }

```

*Example*

```

<entry>
 <form>
 <orth>disproof</orth>
 <pron>dIs"pru:f</pron>
 </form>
 <gramGrp>
 <pos>n</pos>
 </gramGrp>
 <sense n="1">
 <def>facts that disprove something.</def>
 </sense>
 <sense n="2">
 <def>the act of disproving.</def>
 </sense>
</entry>

```

*Note* Like all elements, <entry> inherits an xml:id attribute from the class *global*. No restrictions are placed on the method used to construct xml:ids; one convenient method is to use the orthographic form of the headword, appending a disambiguating number where necessary. Identification codes are sometimes included on machine-readable tapes of dictionaries for in-house use. It is recommended to use the <sense> element even for an entry that has only one sense to group together all parts of the definition relating to the word sense since this leads to more consistent encoding across entries.

**<entryFree>** (unstructured entry) contains a single unstructured entry in any kind of lexical resource, such as a dictionary or lexicon. [9.1. *Dictionary Body and Overall Structure* 9.2. *The Structure of Dictionary Entries*]

*Module* dictionaries — Dictionaries

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

}

```

*Example*

```

<equipment>
 <p>"Hi-8" 8 mm NTSC camcorder with integral directional
 microphone and windshield and stereo digital sound
 recording channel.
 </p>
</equipment>

```

*Example*

```

<equipment>
 <p>8-track analogue transfer mixed down to 19 cm/sec audio
 tape for cassette mastering</p>
</equipment>

```

**<equiv/>** (equivalent) specifies a component which is considered equivalent to the parent element, either by co-reference, or by external link. [3.3.4. *Terms, Glosses, Equivalents, and Descriptions* 22.4.1. *Description of Components*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.internetMedia  
 (@mimeType)

@name a single word which follows the rules defining a legal XML name (see  
<http://www.w3.org/TR/REC-xml/#dt-name>), naming the underlying concept of which the parent  
 is a representation.

*Status* Optional

*Datatype* data.name

@uri (uniform resource identifier) references the underlying concept of which the parent is a  
 representation by means of some external identifier

*Status* Optional

*Datatype* data.pointer

@filter references an external script which contains a method to transform instances of this element to  
 canonical TEI

*Status* Optional

*Datatype* data.pointer

*Member of* model.glossLike

*Contained by*

*header:* category taxonomy

*linking:* joinGrp

*tagdocs:* attDef classSpec constraintSpec elementSpec macroSpec moduleSpec schemaSpec vallItem

*May contain* Empty element

*Declaration*

```

element equiv
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,

```

```

 att.internetMedia.attributes,
 attribute name { data.name }?,
 attribute uri { data.pointer }?,
 attribute filter { data.pointer }?,
 empty
 }

```

*Example* The following example declares that the <bo> element is conceptually equivalent to the markup construct <hi rend='bold'>, and that an external definition of this concept is available from the URI indicated

```

<elementSpec ident="hi" mode="change">
 <equiv name="BOLD"/>
 <desc>bold typography</desc>
 <attList>
 <attDef ident="rend" mode="change">
 <valList>
 <valItem ident="bold"/>
 </valList>
 </attDef>
 </attList>
</elementSpec>
<elementSpec ident="bo" mode="add">
 <equiv
 name="BOLD"
 uri="http://www.example.com/typesetting/bold"/>
</elementSpec>

```

*Note* The mimeType attribute should be used to supply the MIME media type of the filter script specified by the filter attribute.

---

**<eTree>** (embedding tree) provides an alternative to tree element for representing ordered rooted tree structures.  
 [19.3. Another Tree Notation]

*Module* nets — Graphs, Networks, and Trees

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.typed (@type,  
 @subtype)  
 @value provides the value of an embedding tree, which is a feature structure or other analytic element.  
*Status* Optional  
*Datatype* data.pointer  
*Values* A valid identifier of a feature structure or other analytic element.

*Member of* model.divPart

</entry> (From: Webster's Second International)

```

*Note* May contain character data mixed with any other elements defined in the dictionary tag set. There is no consensus on the internal structure of etymologies, or even on whether such a structure is appropriate. The <etym> element accordingly simply contains prose, within which names of languages, cited words, or parts of words, glosses, and examples will typically be prominent. The tagging of such internal objects is optional.

**<event>** (event) contains data relating to any kind of significant event associated with a person, place, or organization. [13.3.1. Basic Principles]

**<f>** (feature) represents a *feature value specification*, that is, the association of a name with a value of any of several different types. [18.2. Elementary Feature Structures and the Binary Feature Value]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.datcat (@datcat,  
 @valueDatcat)

@name a single word which follows the rules defining a legal XML name (see <http://www.w3.org/TR/REC-xml/#dt-name>), providing a name for the feature.

*Status* Required

*Datatype* data.name

*Values* Any name.

@fVal (feature value) references any element which can be used to represent the value of a feature.

*Status* Optional

*Datatype* data.pointer

*Values* the identifier of an element representing a feature value

*Note* If this attribute is supplied as well as content, the value referenced is to be unified with that contained.

*Member of*

*iso-fs*: bicond cond fLib fs if

*May contain*

*gaiji*: g

*iso-fs*: binary default fs numeric string symbol vAlt vColl vLabel vMerge vNot

*Declaration*

```

element f
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.datcat.attributes,
 attribute name { data.name },
 attribute fVal { data.pointer }?,
 (text | model.gLike | model.featureVal)*
}

```

*Schematron* <s:rule context="tei:fVal"> <s:assert test="not(tei:\* and text)"> A feature value cannot contain both text and element content</s:assert></s:rule> <s:rule context="tei:fVal"> <s:report test="count(tei:\*)>1"> A feature value can contain only one child element</s:report></s:rule>

*Example*

```

<f name="gender">
 <symbol value="feminine"/>
</f>

```

*Example*

```

<fs>
 <f name="voice">active</f>
 <f name="tense">SimPre</f>
</fs>

```

*Note* If the element is empty then a value must be supplied for the fVal attribute. The content of <f> may also be textual, with the assumption that the data type of the feature value is determined by the schema—this is the approach used in many language-technology-oriented projects and recommendations.

---

**<facsimile>** contains a representation of some written source in the form of a set of images rather than as transcribed or encoded text. [11.1. Digital Facsimiles]

**<factuality>** describes the extent to which the text may be regarded as imaginative or non-imaginative, that is, as describing a fictional or a non-fictional world. [15.2.1. *The Text Description*]

*Module* corpus — Language Corpora

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type categorizes the factuality of the text.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **fiction** the text is to be regarded as entirely imaginative

**fact** the text is to be regarded as entirely informative or factual

**mixed** the text contains a mixture of fact and fiction

**inapplicable** the fiction/fact distinction is not regarded as helpful or appropriate to this text

*Member of* model.textDescPart

```

*Example*

```
<factuality type="mixed">contains a mixture of gossip and
speculation about real people and events</factuality>
```

*Note* Usually empty, unless some further clarification of the type attribute is needed, in which case it may contain running prose. For many literary texts, a simple binary opposition between ‘fiction’ and ‘fact’ is naïve in the extreme; this parameter is not intended for purposes of subtle literary analysis, but as a simple means of characterizing the claimed fictiveness of a given text. No claim is made that works characterized as ‘fact’ are in any sense ‘true’.

**<faith>** specifies the faith, religion, or belief set of a person. [13.3.2.1. *Personal Characteristics*]

**<fDecl>** (feature declaration) declares a single feature, specifying its name, organization, range of allowed values, and optionally its default value. [18.11. Feature System Declaration]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@name a single word which follows the rules defining a legal XML name (see <http://www.w3.org/TR/REC-xml/#dt-name>), indicating the name of the feature being declared; matches the name attribute of <f> elements in the text.

*Status* Required

*Datatype* data.name

*Values* any string of characters

@optional indicates whether or not the value of this feature may be present.

*Status* Optional

*Datatype* data.truthValue

*Default* true

*Note* If a feature is marked as optional, it is possible for it to be omitted from a feature structure. If an obligatory feature is omitted, then it is understood to have a default value, either explicitly declared, or, if no default is supplied, the special value any. If an optional feature is omitted, then it is understood to be missing and any possible value (including the default) is ignored.

*Members defined by*

iso-fs: fsDecl

*May contain*

In this example, the reference to ‘Dujchev N17’ includes a link to some other manuscript description which has the identifier DN17.

#### Example

```
<msItem>
 <title>Guan-ben</title>
 <filiation>
 <p>The "Guan-ben" was widely current among mathematicians in the
 Qing dynasty, and "Zhao Qimei version" was also read. It is
 therefore difficult to know the correct filiation path to follow.
 The study of this era is much indebted to Li Di. We explain the
 outline of his conclusion here. Kong Guangsen
 (1752-1786)(17) was from the same town as Dai Zhen, so he obtained
 "Guan-ben" from him and studied it(18). Li Huang (d. 1811)
 (19) took part in editing Si Ku Quan Shu, so he must have had
 "Guan-ben". Then Zhang Dunren (1754-1834) obtained this version,
 and studied "Da Yan Zong Shu Shu" (The General Dayan
 Computation). He wrote Jiu Yi Suan Shu (Mathematics
 Searching for One, 1803) based on this version of Shu Xue Jiu
 Zhang (20).</p>
 <p>One of the most important persons in restoring our knowledge
 concerning the filiation of these books was Li Rui (1768(21)
 -1817)(see his biography). ... only two volumes remain of this
 manuscript, as far as chapter 6 (chapter 3 part 2) p.13, that is,
 question 2 of "Huan Tian San Ji" (square of three loops),
 which later has been lost.</p>
 </filiation>

```

*Note* The global `xml:lang` attribute should be supplied for this element to identify the language of the word or phrase marked. As elsewhere, its value should be a language tag as defined in *vi.1 Language identification*. This element is intended for use only where no other element is available to mark the phrase or words concerned. The global `xml:lang` attribute should be used in preference to this element where it is intended to mark the language of the whole of some text element.

The `<distinct>` element may be used to identify phrases belonging to sublanguages or registers not generally regarded as true languages.

 </div>
</front>

```

**<fs>** (feature structure) represents a *feature structure*, that is, a collection of feature-value pairs organized as a structural unit. [18.2. Elementary Feature Structures and the Binary Feature Value]

Module iso-fs — Feature Structures

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.datcat (@datcat,  
 @valueDatcat)

@type specifies the type of the feature structure.

Status Optional

Datatype data.enumerated

@feats (features) references the feature-value specifications making up this feature structure.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* one or more identifiers of <f> elements.

*Note* May be used either instead of having features as content, or in addition. In the latter case, the features referenced and contained are unified.

*Member of* model.featureVal.complex model.global.meta

}

```

*Example*

```

<fsConstraints>
 <cond>
 <fs>
<!-- ... -->
 </fs>
 <then/>
 <fs>
<!-- ... -->
 </fs>
 </cond>
</fsConstraints>

```

*Note* May contain a series of conditional or biconditional elements.

**<fsdDecl>** (feature system declaration) provides a feature system declaration comprising one or more feature structure declarations or feature structure declaration links. [18.11. Feature System Declaration]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of* model.encodingDescPart model.resourceLike

*Contained by*

*core:* teiCorpus

*header:* encodingDesc

*textstructure:* TEI

*May contain*

*iso-fs:* fsDecl fsdLink

*Declaration*

```

element fsdDecl
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (fsDecl | fsdLink)+
}

```

*Example*

```

<fsdDecl>
 <fsDecl type="GPSG">
 <fDecl xml:id="GPSG-1" name="GPSG_feat1">
 <vRange>
 <vAlt>
 <symbol value="red"/>
 <symbol value="blue"/>
 <symbol value="green"/>
 </vAlt>
 </vRange>
 </fDecl>
 <!--other feature declarations for GPSG here ... -->
</fsDecl>
<fsdLink
 type="subentry"
 target="http://www.example.com/fsdLib.xml#LX123"/>
</fsdDecl>

```

**<fsDecl>** (feature structure declaration) declares one type of feature structure. [18.11. Feature System Declaration]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type gives a name for the type of feature structure being declared.

*Status* Required

*Datatype* data.enumerated

*Values* any convenient string of characters.

@baseTypes gives the name of one or more typed feature structures from which this type inherits feature specifications and constraints; if this type includes a feature specification with the same name as that of any of those specified by this attribute, or if more than one specification of the same name is inherited, then the set of possible values is defined by unification. Similarly, the set of constraints applicable is derived by combining those specified explicitly within this element with those implied by the baseTypes attribute. When no baseTypes attribute is specified, no feature specification or constraint is inherited.

*Status* Optional

*Datatype* 1–∞ occurrences of data.name separated by whitespace

*Values* one or more names as defined by the W3C XML Specification

*Note* Inheritance is defined here as a monotonous relation. The process of combining constraints may result in a contradiction, for example if two specifications for the same feature specify disjoint ranges of values, and at least one such specification is mandatory. In such a case, there is no valid representative for the type being defined.

*Members defined by*

iso-fs: fsDecl

*May contain*

iso-fs: fDecl fsConstraints fsDescr

*Declaration*

```
element fsDecl
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute type { data.enumerated },
 attribute baseTypes { list { data.name+ } }?,
 (fsDescr?, fDecl+, fsConstraints?)
}
```

*Example*

```
<fsDecl type="SomeName">
 <fsDescr>Describes what this type of fs represents</fsDescr>
 <fDecl name="featureOne">
<!-- The declaration for featureOne -->
 <vRange>

Declaration

```

element fvLib
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 model.featureVal*
}

```

Example

```

<fvLib n="symbolic values">
 <symbol xml:id="sfirst" value="first"/>
 <symbol xml:id="ssecond" value="second"/>
 <!-- ... -->
 <symbol xml:id="ssing" value="singular"/>
 <symbol xml:id="splur" value="plural"/>
 <!-- ... -->
</fvLib>

```

*Note* A feature value library may include any number of values of any kind, including multiple occurrences of identical values such as <binary value="true"/> or default. The only thing guaranteed unique in a feature value library is the set of labels used to identify the values.

**<fw>** (forme work) contains a running head (e.g. a header, footer), catchword, or similar material appearing on the current page. [11.6. Headers, Footers, and Similar Matter]

*Module* transcr — Representation of Primary Sources

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.placement (@place)

@type classifies the material encoded according to some useful typology.

*Status* Recommended

*Datatype* data.enumerated

*Sample values include:* **header** a running title at the top of the page

**footer** a running title at the bottom of the page

**pageNum** (page number) a page number or foliation symbol

**lineNum** (line number) a line number, either of prose or poetry

**sig** (signature) a signature or gathering symbol

**catch** (catchword) a catch-word

verse: caesura rhyme

#### Declaration

```

element fw
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.placement.attributes,
 attribute type { data.enumerated }?,
 macro.phraseSeq
}

```

#### Example

```
<fw type="sig" place="bottom">C3</fw>
```

**Note** Where running heads are consistent throughout a chapter or section, it is usually more convenient to relate them to the chapter or section, e.g. by use of the *rend* attribute. The *<fw>* element is intended for cases where the running head changes from page to page, or where details of page layout and the internal structure of the running heads are of paramount importance.

**<g>** (character or glyph) represents a glyph, or a non-standard character. [5. *Non-standard Characters and Glyphs*]

**Module** gaiji — Non-standard Characters and Glyphs

**Attributes** att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.typed (@type,  
 @subtype)

@ref points to a description of the character or glyph intended.

**Status** Optional

**Datatype** data.pointer

**Values** a pointer to some another element.

 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.typed.attributes,
 attribute ref { data.pointer }?,
 text
}

```

#### Example

```
<g ref="#ctlig">ct</g>
```

This example points to a <glyph> element with the identifier `ctlig` like the following:

```

<glyph xml:id="ctlig">
 <!-- here we describe the particular ct-ligature intended -->
</glyph>

```

#### Example

```
<g ref="#per-glyph">per</g>
```

The medieval brevisgraph `per` could similarly be considered as an individual glyph, defined in a <glyph> element with the identifier `per` like the following:

```

<glyph xml:id="per-glyph">
 <!-- ... -->
</glyph>

```

*Note* The name `g` is short for *gaiji*, which is the Japanese term for a non-standardized character or glyph.

---

**<gap>** (gap) indicates a point where material has been omitted in a transcription, whether for editorial reasons described in the TEI header, as part of sampling practice, or because the material is illegible, invisible, or inaudible. [3.4.3. *Additions, Deletions, and Omissions*]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.duration  
 (att.duration.w3c (@dur)) (att.duration.iso (@dur-iso)) att.editLike (@evidence, @source, @instant)  
 (att.dimensions (@unit, @quantity, @extent, @precision, @scope)) (att.ranging (@atLeast, @atMost, @min,  
 @max, @confidence)) (att.responsibility (@cert, @resp))

@reason gives the reason for omission. Sample values include sampling, inaudible, irrelevant, cancelled.

*Status* Optional

*Datatype* 1-∞ occurrences of `data.word` separated by whitespace

*Values* any short indication of the reason for the omission.

@hand in the case of text omitted from the transcription because of deliberate deletion by an identifiable hand, signifies the hand which made the deletion.

*Status* Optional

*Datatype* `data.pointer`

*Values* must point to a hand identifier typically but not necessarily declared in the document header (see section 11.3.2.1. *Document Hands*).

@agent In the case of text omitted because of damage, categorizes the cause of the damage, if it can be identified.

*Status* Optional

*Datatype* `data.enumerated`

*Sample values include:* **rubbing** damage results from rubbing of the leaf edges

**mildew** damage results from mildew on the leaf surface

**smoke** damage results from smoke

```

*Note* The <gap>, <unclear>, and <del> core tag elements may be closely allied in use with the <damage> and <supplied> elements, available when using the additional tagset for transcription of primary sources. See section 11.3.3.2. *Use of the <gap>, <del>, <damage>, <unclear>, and <supplied> Elements in Combination* for discussion of which element is appropriate for which circumstance. The <gap> tag simply signals the editors decision to omit or inability to transcribe a span of text. Other information, such as the interpretation that

text was deliberately erased or covered, should be indicated using the relevant tags, such as <del> in the case of deliberate deletion.

**<gb/>** (gathering begins) marks the point in a transcribed codex at which a new gathering or quire begins. [3.10.3. Milestone Elements]

 att.global.change.attributes,
 att.declaring.attributes,
 text
}

```

#### Example

```

<geoDecl xml:id="WGS" datum="WGS84">World Geodetic System</geoDecl>
<geoDecl xml:id="OS" datum="OSGB36">Ordnance Survey</geoDecl>
<!-- -->
<location>
 <desc>A tombstone plus six lines of
 Anglo-Saxon text, built into the west tower (on the south side
 of the archway, at 8 ft. above the ground) of the
 Church of St. Mary-le-Wigford in Lincoln. </desc>
 <geo decls="#WGS">53.226658 -0.541254</geo>
 <geo decls="#OS">SK 97481 70947</geo>
</location>

```

#### Example

```

<geo>41.687142 -74.870109</geo>

```

*Note* Uses of <geo> can be associated with a coordinate system, defined by a <geoDecl> element supplied in the TEI header, using the decls attribute. If no such link is made, the assumption is that the content of each <geo> element will be a pair of numbers separated by whitespace, to be interpreted as latitude followed by longitude according to the World Geodetic System.

---

**<geoDecl>** (geographic coordinates declaration) documents the notation and the datum used for geographic coordinates expressed as content of the <geo> element elsewhere within the document. [2.3.8. *The Geographic Coordinates Declaration*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.declarable (@default)  
 @datum supplies a commonly used code name for the datum employed.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **WGS84** (World Geodetic System) a pair of numbers to be interpreted as latitude followed by longitude according to the World Geodetic System.[Default]

**MGRS** (Military Grid Reference System) the values supplied are geospatial entity object codes, based on

**OSGB36** (ordnance survey great britain) the value supplied is to be interpreted as a British National Grid Reference.

**ED50** (European Datum coordinate system) the value supplied is to be interpreted as latitude followed by longitude according to the European Datum coordinate system.

element gi
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute scheme { data.enumerated }?,
 data.name}

```

## Example

```

<p>The <gi>xhtml:li</gi> element is roughly analogous to the <gi>item</gi> element, as is the
<gi scheme="DBK">listItem</gi> element.</p>

```

This example shows the use of both a namespace prefix and the schema attribute as alternative ways of indicating that the gi in question is not a TEI element name: in practice only one method should be adopted.

)
}

```

*Example*

```

<glyph xml:id="rstroke">
 <glyphName>LATIN SMALL LETTER R WITH A FUNNY STROKE</glyphName>
 <charProp>
 <localName>entity</localName>
 <value>rstroke</value>
 </charProp>
 <figure>
 <graphic url="glyph-rstroke.png"/>
 </figure>
</glyph>

```

**<glyphName>** (character glyph name) contains the name of a glyph, expressed following Unicode conventions for character names. [5.2. Markup Constructs for Representation of Characters and Glyphs]

*Module* gaiji — Non-standard Characters and Glyphs

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of*

*Contained by*

*gaiji:* glyph

*May contain* Character data only

*Declaration*

```

element glyphName
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 text
}

```

*Example*

<glyphName>CIRCLED IDEOGRAPH 4EBA</glyphName>

*Note* For characters of non-ideographic scripts, a name following the conventions for Unicode names should be chosen. For ideographic scripts, an *Ideographic Description Sequence* (IDS) as described in Chapter 10.1 of the Unicode Standard is recommended where possible. Projects working in similar fields are recommended to coordinate and publish their list of <glyphName>s to facilitate data exchange.

**<gram>** (grammatical information) within an entry in a dictionary or a terminological data file, contains grammatical information relating to a term, word, or form. [9.3.2. *Grammatical Information*]

*Module* dictionaries — Dictionaries

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.lexicographic  
(@expand, @norm, @split, @value, @orig, @location, @mergedIn, @opt) (att.datcat (@datcat, @valueDatcat))

@type classifies the grammatical information given according to some convenient typology—in the case of terminological information, preferably the dictionary of data element types specified in ISO 12620.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **pos** (part of speech) any of the word classes to which a word may be assigned in a given language, based on form, meaning, or a combination of features, e.g. noun, verb, adjective, etc.

**gen** (gender) formal classification by which nouns and pronouns, and often accompanying modifiers, are grouped and inflected, or changed in form, so as to control certain syntactic relationships

**num** (number) grammatical number, e.g. singular, plural, dual, ...

**animate** animate or inanimate

**proper** proper noun or common noun

*Note* A much fuller list of values for the type attribute may be generated from the data category registry accessible from <http://www.isocat.org> and maintained by ISO technical committee 37.

</entry>

```

**<graph>** encodes a graph, which is a collection of nodes, and arcs which connect the nodes. [19.1. *Graphs and Digraphs*]

*Module* nets — Graphs, Networks, and Trees

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type describes the type of graph.

*Status* Recommended

*Datatype* data.enumerated

*Suggested values include:* **undirected** undirected graph

**directed** directed graph

**transitionNetwork** a directed graph with distinguished initial and final nodes

**transducer** a transition network with up to two labels on each arc

*Note* If type is specified as undirected, then the distinction between the to and from attributes of the <arc> tag is neutralized. Also, the adj attribute, rather than the adjFrom and adjTo attributes, should be used to encode pointers to the ends of the arcs. If type is specified as directed (or any other value which implies directionality), then the adjFrom and adjTo attributes should be used, instead of the adj attribute.

@order states the order of the graph, i.e., the number of its nodes.

*Status* Optional

*Datatype* data.count

@size states the size of the graph, i.e., the number of its arcs.

*Status* Optional

*Datatype* data.count

*Example*

```

<l>When wolde the cat dwelle in his ynn</l>
<handShift medium="greenish-ink"/>
<l>And if the cattes skynne be slyk <handShift medium="black-ink"/> and gaye</l>

```

*Note* The <handShift> element may be used either to denote a shift in the document hand (as from one scribe to another, on one writing style to another). Or, it may indicate a shift within a document hand, as a change of writing style, character or ink. Like other milestone elements, it should appear at the point of transition from some other state to the state which it describes.

 att.typed.attributes,
 (
 text
 | lg
 | model.gLike
 | model.phrase
 | model.inter
 | model.lLike
 | model.global
)*
}

```

*Example* The most common use for the <head> element is to mark the headings of sections. In older writings, the headings or *incipits* may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a <trailer>, as in this example:

```

<div1 n="I" type="book">
 <head>In the name of Christ here begins the first book of the ecclesiastical history of
 Georgius Florentinus, known as Gregory, Bishop of Tours.</head>
 <div2 type="section">
 <head>In the name of Christ here begins Book I of the history.</head>
 <p>Proposing as I do ...</p>
 <p>From the Passion of our Lord until the death of Saint Martin four hundred and twelve
 years passed.</p>
 <trailer>Here ends the first Book, which covers five thousand, five hundred and ninety-six
 years from the beginning of the world down to the death of Saint Martin.</trailer>
 </div2>
</div1>

```

```

 </div2>
 </div1>

```

*Example* The <head> element is also used to mark headings of other units, such as lists:

```

With a few exceptions, connectives are equally
useful in all kinds of discourse: description, narration, exposition, argument. <list type="simple">
 <head>Connectives</head>
 <item>above</item>
 <item>accordingly</item>
 <item>across from</item>
 <item>adjacent to</item>
 <item>again</item>
 <item>
<!-- ... -->
</item>
</list>

```

*Note* The <head> element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a <head> element based on its structural position. A <head> occurring as the first element of a list is the title of that list; one occurring as the first element of a <div1> is the title of that chapter or section.

---

**<headItem>** (heading for list items) contains the heading for the item or gloss column in a glossary list or similar structured list. [3.7. Lists]

---

**<hyphenation>** summarizes the way in which hyphenation in a source text has been treated in an encoded version of it. [2.3.3. *The Editorial Practices Declaration* 15.3.2. *Declarable Elements*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.declarable (@default)  
@eol (end-of-line) indicates whether or not end-of-line hyphenation has been retained in a text.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **all** all end-of-line hyphenation has been retained, even though the  
lineation of the original may not have been.

**some** end-of-line hyphenation has been retained in some cases. [Default]

**hard** all soft end-of-line hyphenation has been removed: any remaining end-of-line  
hyphenation should be retained.

**none** all end-of-line hyphenation has been removed: any remaining hyphenation  
occurred within the line.

### Example

```
<idno type="ISBN">978-1-906964-22-1</idno>
<idno type="ISSN">0143-3385</idno>
<idno type="DOI">http://dx.doi.org/10.1000/123</idno>
<idno type="URL">http://authority.nzetc.org/463</idno>
<idno type="LT">Thomason Tract E.537(17)</idno>
<idno type="Wing">C695</idno>
<idno type="oldCat">
 <g ref="#sym"/>345
</idno>
```

In the last case, the identifier includes a non-Unicode character which is defined elsewhere by means of a <glyph> or <char> element referenced here as #sym.

*Note* <idno> should be used for labels which identify an object or concept in a formal cataloguing system such as a database or an RDF store, or in a distributed system such as the World Wide Web.

**<if>** defines a conditional default value for a feature; the condition is specified as a feature structure, and is met if it subsumes the feature structure in the text for which a default value is sought. [18.11. Feature System Declaration]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of*

*Contained by*

*iso-fs:* vDefault

*May contain*

*iso-fs:* binary default f fs numeric string symbol then vAlt vColl vLabel vMerge vNot

*Declaration*

```

element if
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 ((fs | f), then, (model.featureVal))
}

```

*Example*

```

<vDefault>
 <if>
 <fs>
 <f name="VFORM">
 <symbol value="INF"/>
 </f>
 <f name="SUBJ">
 <binary value="true"/>
 </f>
 </fs>
 <then/>
 <symbol value="for"/>
 </if>
</vDefault>

```

*Note* May contain a feature structure, followed by a feature value; the two are separated by a <then> element.

**<iff/>** (if and only if) separates the condition from the consequence in a bicond element. [18.11. Feature System Declaration]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of*

*Contained by*

*iso-fs:* bicond

May contain Empty element

Declaration

```

element iff
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 empty
}

```

Example

```

<bicond>
 <fs>
 <f name="F00">
 <symbol value="42" />
 </f>
 </fs>
</iff>
<fs>
 <f name="BAR">
 <binary value="true" />
 </f>
</fs>
</bicond>

```

*Note* This element is provided primarily to enhance the human readability of the feature-system declaration.

---

**<imprimatur>** contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso. [4.6. Title Pages]

*Module* textstructure — Default Text Structure

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

<incipit type="biblical">Ghif ons huden onse dagelix broet</incipit>
<incipit>0 onghoerde gewerdighe christi</incipit>
<incipit type="lemma">Firmiter</incipit>
<incipit>Ideo dicit firmiter quia ordo fidei nostre probari non potest</incipit>

```

---

**<index>** (index entry) marks a location to be indexed for whatever purpose. [3.8.2. *Index Entries*]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.spanning (@spanTo)

@indexName a single word which follows the rules defining a legal XML name (see <http://www.w3.org/TR/REC-xml/#dt-name>), supplying a name to specify which index (of several) the index entry belongs to.

*Status* Optional

*Datatype* data.name

*Values* an application-specific name, consisting of Unicode characters only.

*Note* This attribute makes it possible to create multiple indexes for a text.

*Member of* model.global.meta

*Contained by*

*analysis:* cl m phr s span w

}

```

### Example

```

David's other principal backer, Josiah ha-Kohen
<index indexName="NAMES">
 <term>Josiah ha-Kohen b. Azarya</term>
</index> b. Azarya, son of one of the last gaons of Sura <index indexName="PLACES">
 <term>Sura</term>
</index> was David's own first cousin.

```

---

**<iNode>** (intermediate (or internal) node) represents an intermediate (or internal) node of a tree. [19.2. Trees]

Module nets — Graphs, Networks, and Trees

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@value provides the value of an intermediate node, which is a feature structure or other analytic element.

Status Optional

Datatype data.pointer

Values A valid identifier of a feature structure or other analytic element.

@children provides a list of identifiers of the elements which are the children of the intermediate node.

Status Required

Datatype 1–∞ occurrences of data.pointer separated by whitespace

Values A list of identifiers.

@parent provides the identifier of the element which is the parent of this node.

Status Optional

Datatype data.pointer

Values The identifier of the parent node.

@ord (ordered) indicates whether or not the internal node is ordered.

Status Optional

Datatype data.xTruthValue

Note The value true indicates that the children of the intermediate node are ordered, whereas false indicates they are unordered. Use if and only if ord is specified as partial on the <tree> element and the intermediate node has more than one child.

@follow provides an identifier of the element which this node follows.

Status Optional

Datatype data.pointer

Values The identifier of another intermediate node or leaf of the tree.

Note If the tree is unordered or partially ordered, this attribute has the property of fixing the relative order of the intermediate node and the element which is the value of the attribute.

@outDegree gives the out degree of an intermediate node, the number of its children.

Status Optional

Datatype data.count

Note The in degree of an intermediate node is always 1.

Member of

nets: tree

May contain

core: label

Declaration

```
element iNode
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute value { data.pointer }?,
 attribute children { list { data.pointer+ } },
 attribute parent { data.pointer }?,
 attribute ord { data.xTruthValue }?,
 attribute follow { data.pointer }?,
 attribute outDegree { data.count }?,
 label?
}
```

Example

```
<iNode
 xml:id="pt1"
 children="#GD-UP1"
 parent="#GD-VB1"
 follow="#GD-PN1"
 outDegree="1">
 <label>PT</label>
</iNode>
```

**<institution>** contains the name of an organization such as a university or library, with which a manuscript is identified, generally its holding institution. [10.4. The Manuscript Identifier]

Module msdescription — Manuscript Description

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.naming (@role,  
@nymRef) (att.canonical (@key, @ref))

 <institution>University of Oxford</institution>
 <repository>Bodleian Library</repository>
 <idno>MS. Bodley 406</idno>
</msIdentifier>
```

---

**<interaction>** describes the extent, cardinality and nature of any interaction among those producing and experiencing the text, for example in the form of response or interjection, commentary, etc. [15.2.1. *The Text Description*]

Module corpus — Language Corpora

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type specifies the degree of interaction between active and passive participants in the text.

Status Optional

Datatype data.enumerated

Legal values are: **none** no interaction of any kind, e.g. a monologue

**partial** some degree of interaction, e.g. a monologue with set responses

**complete** complete interaction, e.g. a face to face conversation

**inapplicable** this parameter is inappropriate or inapplicable in this case

@active specifies the number of active participants (or *addressors*) producing parts of the text.

Status Optional

Datatype data.enumerated

Suggested values include: **singular** a single addressor

**plural** many addressors

**corporate** a corporate addressor

**unknown** number of addressors unknown or unspecifiable

@passive specifies the number of passive participants (or *addressees*) to whom a text is directed or in whose presence it is created or performed.

Status Optional

Datatype data.enumerated

Suggested values include: **self** text is addressed to the originator e.g. a diary

**single** text is addressed to one other person e.g. a personal letter

**many** text is addressed to a countable number of others e.g. a conversation in which all participants are identified

**group** text is addressed to an undefined but fixed number of participants e.g. a lecture

**world** text is addressed to an undefined and indeterminately large number e.g. a published book

#### Example

```

<list type="ordered">
 <head>Here begin the chapter headings of Book IV</head>
 <item n="4.1">The death of Queen Clotild.</item>
 <item n="4.2">How King Lothar wanted to appropriate one third of the Church revenues.</item>
 <item n="4.3">The wives and children of Lothar.</item>
 <item n="4.4">The Counts of the Bretons.</item>
 <item n="4.5">Saint Gall the Bishop.</item>
 <item n="4.6">The priest Cato.</item>
 <item> ...</item>
</list>

```

*Note* May contain simple prose or a sequence of chunks. Whatever string of characters is used to label a list item in the copy text may be used as the value of the global *n* attribute, but it is not required that numbering be recorded explicitly. In ordered lists, the *n* attribute on the *<item>* element is by definition synonymous with the use of the *<label>* element to record the enumerator of the list item. In glossary lists, however, the term being defined should be given with the *<label>* element, not *n*.

**<iType>** (inflectional class) indicates the inflectional class associated with a lexical item. [9.3.1. *Information on Written and Spoken Forms*]

*Module* dictionaries — Dictionaries

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.lexicographic  
 (@expand, @norm, @split, @value, @orig, @location, @mergedIn, @opt) (att.datcat (@datcat, @valueDatcat))

@type indicates the type of indicator used to specify the inflection class, when it is necessary to distinguish between the usual abbreviated indications (e.g. *inv*) and other kinds of indicators, such as special codes referring to conjugation patterns, etc.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **abbrev** abbreviated indicator

**verbTable** coded reference to a table of verbs

*Note* This element is synonymous with *<gram type='inflectional type'>*.

```

*Note* May contain character data and phrase-level elements. Typical content will be *invariant*, *n* 3 etc.

**<join>** identifies a possibly fragmented segment of text, by pointing at the possibly discontinuous elements which compose it. [16.7. Aggregation]

*Module* linking — Linking, Segmentation, and Alignment

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.pointing (@targetLang,  
@target, @evaluate) att.typed (@type, @subtype)

@targets specifies the identifiers of the elements or passages to be joined into a virtual element.

*Deprecated* will be removed on 2013-09-20

*Status* Optional

*Datatype* 2–∞ occurrences of `data.pointer` separated by whitespace

*Values* two or more pointers (URIs), separated by whitespace

*Note* This attribute is deprecated. It is retained for backward compatibility only; the attribute target should be used for preference. It is an error to supply both attributes, but one or the other must be present.

@result specifies the name of an element which this aggregation may be understood to represent.

*Status* Optional

*Datatype* `data.name`

*Values* The generic identifier of an element in the current schema.

@scope indicates whether the targets to be joined include the entire element indicated (the entire subtree including its root), or just the children of the target (the branches of the subtree).

*Status* Recommended

*Datatype* `data.enumerated`

*Legal values are:* **root** the rooted subtrees indicated by the targets attribute are joined, each subtree become a child of the virtual element created by the join[Default]

**branches** the children of the subtrees indicated by the targets attribute become the children of the virtual element (i.e. the roots of the subtrees are discarded)

 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.pointing.attributes,
 att.typed.attributes,
 attribute targets { list { data.pointer, data.pointer, data.pointer* } }?,
 attribute result { data.name }?,
 attribute scope { "root" | "branches" }?,
 (model.descLike | model.certLike)*
}

```

*Schematron* <s:report test="@target and @targets">You may not supply both @target and @targets on <s:name/>  
</s:report>

*Schematron* <s:report test="not(@target) and not(@targets)">You must supply either @target or @targets on  
<s:name/> </s:report>

*Schematron* <s:assert test="contains(@target, ')">You must supply at least two values for @target on <s:name/>  
</s:assert>

*Example* The following example is discussed in section 16.7. *Aggregation*:

```

<sp>
 <speaker>Hughie</speaker>
 <p>How does it go? <q>
 <l xml:id="frog_x1">da-da-da</l>
 <l xml:id="frog_l2">gets a new frog</l>
 <l>...</l>
 </q>
</p>
</sp>
<sp>
 <speaker>Louie</speaker>
 <p>
 <q>
 <l xml:id="frog_l1">When the old pond</l>
 <l>...</l>
 </q>
 </p>
</sp>

```

```
 </q>
 </p>
</sp>
<sp>
 <speaker>Dewey</speaker>
 <p>
 <q>... <l xml:id="frog_l3">It's a new pond.</l>
 </q>
 </p>
 <join target="#frog_l1 #frog_l2 #frog_l3" result="lg" scope="root"/>
</sp>
```

The <join> element here identifies a linegroup (<lg>) comprising the three lines indicated by the target attribute. The value root for the scope attribute indicates that the resulting virtual element contains the three <l> elements linked to at #frog\_l1 #frog\_l2 #frog\_l3, rather than their character data content.

*Example* In this example, the attribute scope is specified with the value of branches to indicate that the virtual list being constructed is to be made by taking the lists indicated by the target attribute of the <join> element, discarding the <list> tags which enclose them, and combining the items contained within the lists into a single virtual list:

```
<p>Southern dialect (my own variety, at least) has only <list xml:id="LP1">
 <item>
 <s>I done gone</s>
 </item>
 <item>
 <s>I done went</s>
 </item>
</list> whereas Negro Non-Standard basilect has both these and <list xml:id="LP2">
 <item>
 <s>I done go</s>
 </item>
</list>.</p>
<p>White Southern dialect also has <list xml:id="LP3">
 <item>
 <s>I've done gone</s>
 </item>
 <item>
 <s>I've done went</s>
 </item>
</list> which, when they occur in Negro dialect, should probably be considered as borrowings from
other varieties of English.</p>
<join
 result="list"
 xml:id="LST1"
 target="#LP1 #LP2 #LP3"
 scope="branches">
 <desc>Sample sentences in Southern speech</desc>
</join>
```

---

**<joinGrp>** (join group) groups a collection of join elements and possibly pointers. [16.7. Aggregation]

*Module* linking — Linking, Segmentation, and Alignment

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

</joinGrp>

```

*Note* Any number of <join> or <ptr> elements.

**<keywords>** contains a list of keywords or phrases identifying the topic or nature of a text. [2.4.3. *The Text Classification*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
 @scheme identifies the controlled vocabulary within which the set of keywords concerned is defined.

*Status* Optional

*Datatype* data.pointer

*Values* may point to a local definition, for example in a <taxonomy> element, or more usually to some external location where the scheme is fully defined.

*Member of*

*header:* textClass

*May contain*

*core:* list term

*Declaration*

```

element keywords
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute scheme { data.pointer }?,
 (term+ | list)
}

```

*Example*

```

<keywords scheme="http://classificationweb.net">
 <term>Babbage, Charles</term>
 <term>Mathematicians - Great Britain - Biography</term>
</keywords>

```

*Example*

```

<keywords>
 <term>Fermented beverages</term>
 <term>Central Andes</term>
 <term>Schinus molle</term>
 <term>Molle beer</term>
 <term>Indigenous peoples</term>
 <term>Ethnography</term>
 <term>Archaeology</term>
</keywords>

```

*Note* Each individual keyword (including compound subject headings) should be supplied as a <term> element directly within the <keywords> element. An alternative usage, in which each <term> appears within a <item> inside a <list> is permitted for backwards compatibility, but is deprecated. If no control list exists for the keywords used, then no value should be supplied for the scheme attribute.

**<kinesic>** marks any communicative phenomenon, not necessarily vocalized, for example a gesture, frown, etc.  
[8.3.3. Vocal, Kinesic, Incident]

*Module* spoken — Transcriptions of Speech

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.timed (@start, @end)  
(att.duration (att.duration.w3c (@dur)) (att.duration.iso (@dur-iso)) ) att.typed (@type, @subtype)  
att.ascribed (@who)

@iterated indicates whether or not the phenomenon is repeated.

*Status* Optional

*Datatype* data.xTruthValue

*Default* false

*Note* The value true indicates that the kinesic is repeated several times rather than occurring only once.

 att.placement.attributes,
 macro.phraseSeq}

```

*Example* Labels are commonly used for the headwords in glossary lists; note the use of the global `xml:lang` attribute to set the default language of the glossary list to Middle English, and identify the glosses and headings as modern English or Latin:

```

<list type="gloss" xml:lang="enm">
 <head xml:lang="en">Vocabulary</head>
 <headLabel xml:lang="en">Middle English</headLabel>
 <headItem xml:lang="en">New English</headItem>
 <label>nu</label>
 <item xml:lang="en">now</item>
 <label>lhude</label>
 <item xml:lang="en">loudly</item>
 <label>bloweth</label>
 <item xml:lang="en">blooms</item>
 <label>med</label>
 <item xml:lang="en">meadow</item>
 <label>wude</label>
 <item xml:lang="en">wood</item>
 <label>awe</label>
 <item xml:lang="en">ewe</item>
 <label>lhouth</label>
 <item xml:lang="en">lows</item>
 <label>sterteth</label>
 <item xml:lang="en">bounds, frisks (cf. <cit>
 <ref>Chaucer, K.T.644</ref>
 <quote>a courser, <term>sterting</term>as the fyr</quote>
 </cit>
 </item>
 <label>verteth</label>
 <item xml:lang="la">pedit</item>
 <label>murie</label>
 <item xml:lang="en">merrily</item>
 <label>swik</label>
 <item xml:lang="en">cease</item>
 <label>naver</label>
 <item xml:lang="en">never</item>
</list>

```

*Example* Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon's *Autobiography*. In this usage the `<label>` element is synonymous with the `n` attribute on the `<item>` element:

```
I will add two facts, which have seldom occurred
in the composition of six, or at least of five quartos. <list rend="runon" type="ordered">
 <label>(1)</label>
 <item>My first rough manuscript, without any intermediate copy, has been sent to the press.</item>
 <label>(2) </label>
 <item>Not a sheet has been seen by any human eyes, excepting those of the author and the
 printer: the faults and the merits are exclusively my own.</item>
</list>
```

*Example* Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:

```
<list type="gloss">
 <label>March 1757.</label>
 <item>I wrote some critical observations upon Plautus.</item>
 <label>March 8th.</label>
 <item>I wrote a long dissertation upon some lines of Virgil.</item>
 <label>June.</label>
 <item>I saw Mademoiselle Curchod – <quote xml:lang="la">Omnia vincit amor, et nos cedamus
 amori.</quote>
 </item>
 <label>August.</label>
 <item>I went to Crassy, and staid two days.</item>
</list>
```

Note that the <label> might also appear within the <item> rather than as its sibling. Though syntactically valid, this usage is not recommended TEI practice.

*Example* Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the <label> element appears *within* the <p> or <lg> element, rather than as a preceding sibling of it.

```
<p>[...]
<lb/>& n'entrer en mauuais & mal-heu-
<lb/>r  mefnage. Or des que le confente-
<lb/>ment des parties y eft le mariage eft
<lb/> arreft , quoy que de faict il ne foit
<label place="margin">Puiffance maritale
 entre les Romains.</label>
<lb/> conform . Depuis la conformma-
<lb/>tion du mariage la femme eft foub 
<lb/> la puiffance du mary, s'il n'eft efcla-
<lb/>ue ou enfant de famille : car en ce
<lb/> cas, la femme, qui a efpou   vn en-
<lb/>fant de famille, eft fous la puiffance
[...]</p>
```

In this example the text of the label appears in the right hand margin of the original source, next to the paragraph it describes, but approximately in the middle of it. If so desired the type attribute may be used to distinguish different categories of label.

---

**<lacunaEnd/>** indicates the end of a lacuna in a mostly complete textual witness. [12.1.5. *Fragmentary Witnesses*]

 May contain Empty element  
 Declaration

```

element lb
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.typed.attributes,
 att.edition.attributes,
 att.spanning.attributes,
 att.breaking.attributes,
 empty
}

```

*Example* This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:

```

<l>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit</l>
<l>Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</l>
<l>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe,</l>

```

*Example* This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The break attribute is used to show that the line break does not (as elsewhere) mark the start of a new word.

```

<titlePart>
 <lb/>With Additions, ne-<lb break="no"/>ver before Printed.
</titlePart>

```

*Note* By convention, <lb> elements should appear at the point in the text where a new line starts. The *n* attribute, if used, indicates the number or other value associated with the text between this point and the next <lb> element, typically the sequence number of the line within the page, or other appropriate unit. This element is intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the <l> element is available) except in circumstances where structural units cannot otherwise be marked. The type attribute may be used to characterize the line break in any respect. The more specialized attributes *break*, *ed*, or *edRef* should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.

---

**<lbl>** (label) contains a label for a form, example, translation, or other piece of information, e.g. abbreviation for, contraction of, literally, approximately, synonyms; etc. [9.3.1. *Information on Written and Spoken Forms* 9.3.3.2. *Translation Equivalents* 9.3.5.3. *Cross-References to Other Entries*]

*Note* Labels specifically relating to usage should be tagged with the special-purpose <usg> element rather than with the generic <lbl> element.

---

**<leaf>** encodes the leaves (terminal nodes) of a tree. [19.2. *Trees*]

*Module* nets — Graphs, Networks, and Trees

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@value provides a pointer to a feature structure or other analytic element.

*Status* Optional

*Datatype* data.pointer

*Values* A valid identifier of a feature structure or other analytic element.

@parent provides the identifier of parent of a leaf.

*Status* Optional

*Datatype* data.pointer

*Values* The identifier of the parent node.

@follow provides an identifier of an element which this leaf follows.

*Status* Optional

*Datatype* data.pointer

*Values* The identifier of another intermediate node or leaf of the tree.

*Note* If the tree is unordered or partially ordered, this attribute has the property of fixing the relative order of the leaf and the element which is the value of the attribute.

*Member of*

*nets:* tree

*May contain*

*core:* label

*Declaration*

```

element leaf

 att.global.facs.attributes,
 att.global.change.attributes,
 attribute value { data.pointer }?,
 attribute parent { data.pointer }?,
 attribute follow { data.pointer }?,
 label?
}

```

*Example*

```

<leaf xml:id="peril" parent="#n1">
 <label>periscope</label>
</leaf>

```

*Note* The in degree of a leaf is always 1, its out degree always 0.

---

*Note* This element should be used only to mark up writing which is topographically organized as a series of lines, horizontal or vertical. It should not be used to mark lines of verse (for which use <l>) nor to mark linebreaks within text which has been encoded using structural elements such as <p> (for which use <lb>).

**<link/>** defines an association or hypertextual link among elements or passages, of some type not more precisely specifiable by other elements. [16.1. Links]

*Module* linking — Linking, Segmentation, and Alignment

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.pointing (@targetLang,  
 @target, @evaluate) att.typed (@type, @subtype)

@targets specifies the identifiers of the elements or passages to be linked or associated.

*Deprecated* will be removed on 2013-09-20

*Status* Optional

*Datatype* 2–∞ occurrences of `data.pointer` separated by whitespace

*Values* two or more pointers (URIs), separated by whitespace

*Note* This attribute is deprecated. It is retained for backward compatibility only; the attribute target should be used for preference. It is an error to supply both attributes, but one or the other must be present.

had not even time to say "I'm going to sleep."</s>
 </p>
<!-- ... -->
</div>

```

*Note* May contain one or more <link> elements only, optionally with interspersed pointer elements. A web or link group is an administrative convenience, which should be used to collect a set of links together for any purpose, not simply to supply a default value for the type attribute.

**<list>** (list) contains any sequence of items organized as a list. [3.7. Lists]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.sortable (@sortKey)  
 @type describes the form of the list.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **ordered** list items are numbered or lettered.

**bulleted** list items are marked with a bullet or other typographic device.

**simple** list items are not numbered or bulleted. [Default]

**gloss** each list item glosses some term or concept, which is given by a label element preceding the list item.

*Note* The formal syntax of the element declarations allows <label> tags to be omitted from lists tagged <list type="gloss">; this is however a semantic error.

}

```

### Example

```

<list type="ordered">
 <item>a butcher</item>
 <item>a baker</item>
 <item>a candlestick maker, with <list type="bullets">
 <item>rings on his fingers</item>
 <item>bells on his toes</item>
 </list>
</list>

```

```

</list>
</item>
</list>

```

*Example* The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):

```

<div1 type="section">
 <head>Athelstan's Ordinance</head>
 <list type="ordered">
 <item n="1">Concerning thieves. First, that no thief is to be spared who is caught with
 the stolen goods, [if he is] over twelve years and [if the value of the goods is] over
 eightpence. <list type="ordered">
 <item n="1.1">And if anyone does spare one, he is to pay for the thief with his
 wergild – and the thief is to be no nearer a settlement on that account – or to
 clear himself by an oath of that amount.</item>
 <item n="1.2">If, however, he [the thief] wishes to defend himself or to escape, he is
 not to be spared [whether younger or older than twelve].</item>
 <item n="1.3">If a thief is put into prison, he is to be in prison 40 days, and he may
 then be redeemed with 120 shillings; and the kindred are to stand surety for him
 that he will desist for ever.</item>
 <item n="1.4">And if he steals after that, they are to pay for him with his wergild,
 or to bring him back there.</item>
 <item n="1.5">And if he steals after that, they are to pay for him with his wergild,
 whether to the king or to him to whom it rightly belongs; and everyone of those who
 supported him is to pay 120 shillings to the king as a fine.</item>
 </list>
 </item>
 <item n="2">Concerning lordless men. And we pronounced about these lordless men, from whom
 no justice can be obtained, that one should order their kindred to fetch back such a
 person to justice and to find him a lord in public meeting. <list type="ordered">
 <item n="2.1">And if they then will not, or cannot, produce him on that appointed day,
 he is then to be a fugitive afterwards, and he who encounters him is to strike him
 down as a thief.</item>
 <item n="2.2">And he who harbours him after that, is to pay for him with his wergild
 or to clear himself by an oath of that amount.</item>
 </list>
 </item>
 <item n="3">Concerning the refusal of justice. The lord who refuses justice and upholds
 his guilty man, so that the king is appealed to, is to repay the value of the goods and
 120 shillings to the king; and he who appeals to the king before he demands justice as
 often as he ought, is to pay the same fine as the other would have done, if he had
 refused him justice. <list type="ordered">
 <item n="3.1">And the lord who is an accessory to a theft by his slave, and it becomes
 known about him, is to forfeit the slave and be liable to his wergild on the first
 occasion; if he does it more often, he is to be liable to pay all that he owns.</item>
 <item n="3.2">And likewise any of the king's treasurers or of our reeves, who has been
 an accessory of thieves who have committed theft, is to liable to the same.</item>
 </list>
 </item>
 <item n="4">Concerning treachery to a lord. And we have pronounced concerning treachery to
 a lord, that he [who is accused] is to forfeit his life if he cannot deny it or is
 afterwards convicted at the three-fold ordeal.</item>
 </list>
</div1>

```

Note that nested lists have been used so the tagging mirrors the structure indicated by the two-level

numbering of the clauses. The clauses could have been treated as a one-level list with irregular numbering, if desired.

*Example*

```
<p>These decrees, most blessed Pope Hadrian, we propounded in the public council ... and they confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards inscribed with a careful pen on the paper of this page, affixing thus the sign of the Holy Cross. <list type="simple">
 <item>I, Eanbald, by the grace of God archbishop of the holy church of York, have subscribed to the pious and catholic validity of this document with the sign of the Holy Cross.</item>
 <item>I, Ælfwold, king of the people across the Humber, consenting have subscribed with the sign of the Holy Cross.</item>
 <item>I, Tilberht, prelate of the church of Hexham, rejoicing have subscribed with the sign of the Holy Cross.</item>
 <item>I, Higbald, bishop of the church of Lindisfarne, obeying have subscribed with the sign of the Holy Cross.</item>
 <item>I, Ethelbert, bishop of Candida Casa, suppliant, have subscribed with the sign of the Holy Cross.</item>
 <item>I, Ealdwulf, bishop of the church of Mayo, have subscribed with devout will.</item>
 <item>I, Æthelwine, bishop, have subscribed through delegates.</item>
 <item>I, Sicga, patrician, have subscribed with serene mind with the sign of the Holy Cross.</item>
</list>
</p>
```

*Note* May contain an optional heading followed by a series of items, or a series of label and item pairs, the latter being optionally preceded by one or two specialized headings.

 Offensive. The battle is considered the first Confederate victory in
 the commonwealth, and threw a scare into Federal commanders, who
 rushed troops to central Kentucky in an effort to repel the invasion,
 which was finally thwarted at the <ref target="#event02">Battle of
 Camp Wildcat</ref> in October.</desc>
 </event>
 <event xml:id="event02" when="1861-10-21">
 <label>Camp Wild Cat</label>
 <desc>The Battle of Camp Wildcat (also known as Wildcat Mountain and Camp
 Wild Cat) was one of the early engagements of the American Civil
 War. It occurred October 21, 1861, in northern Laurel County, Kentucky
 during the campaign known as the Kentucky Confederate Offensive. The
 battle is considered one of the very first Union victories, and marked
 the first engagement of troops in the commonwealth of Kentucky.</desc>
 </event>
 <event xml:id="event03" from="1864-06-11" to="1864-06-12">
 <label>Cynthiana</label>
 <desc>The Battle of Cynthiana (or Kellar's Bridge) was an engagement
 during the American Civil War that was fought on June 11 and 12, 1864,
 in Harrison County, Kentucky, near the town of Cynthiana. A part of
 Confederate Brigadier General John Hunt Morgan's 1864 Raid into
 Kentucky, the battle resulted in a victory by Union forces over the
 raiders and saved the town from capture.</desc>
 </event>
</listEvent>

```

**<listForest>** provides for lists of forests. [19.3. Another Tree Notation]

Module *nets* — Graphs, Networks, and Trees

Attributes *att.global* (*@xml:id*, *@n*, *@xml:lang*, *@rend*, *@style*, *@rendition*, *@xml:base*, *@xml:space*)  
*(att.global.linking* (*@corresp*, *@synch*, *@sameAs*, *@copyOf*, *@next*, *@prev*, *@exclude*, *@select*))  
*(att.global.analytic* (*@ana*)) *(att.global.facs* (*@facs*)) *(att.global.change* (*@change*))

*@type* identifies the type of the forest group.

Status Optional

Datatype data.enumerated

Values A character string.

Member of *model.divPart*

Contained by

</listPlace>

```

---

**<listPrefixDef>** (list of prefix definitions) contains a list of definitions of prefixing schemes used in *data.pointer* values, showing how abbreviated URIs using each scheme may be expanded into full URIs. [16.2.3. *Using Abbreviated Pointers*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of* model.encodingDescPart

*Contained by*

*header:* encodingDesc listPrefixDef

May contain

header: listPrefixDef prefixDef

Declaration

```

element listPrefixDef
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 ((prefixDef | listPrefixDef)+)
}

```

*Example* In this example, two private URI scheme prefixes are defined and patterns are provided for dereferencing them. Each prefix is also supplied with a human-readable explanation in a <p> element.

```

<listPrefixDef>
 <prefixDef ident="psn" matchPattern="([A-Z]+)" replacementPattern="personography.xml#$1">
 <p> Private URIs using the <code>psn</code>
 prefix are pointers to <gi>person</gi>
 elements in the personography.xml file.
 For example, <code>psn:MDH</code>
 dereferences to <code>personography.xml#MDH</code>.
 </p>
 </prefixDef>
 <prefixDef
 ident="bibl"
 matchPattern="([a-z]+[a-z0-9]*)"
 replacementPattern="http://www.example.com/getBibl.xml?id=$1">
 <p> Private URIs using the <code>bibl</code> prefix can be
 expanded to form URIs which retrieve the relevant
 bibliographical reference from www.example.com.
 </p>
 </prefixDef>
</listPrefixDef>

```

**<listRef>** (list of references) supplies a list of significant references to places where this element is discussed, in the current document or elsewhere.

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

</listRef>

```

---

**<listRelation>** provides information about relationships identified amongst people, places, and organizations, either informally as prose or as formally expressed relation links. [13.3.2.3. *Personal Relationships*]

*Module* namesdates — Names, Dates, People, and Places

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.typed (@type,  
@subtype) att.sortable (@sortKey)

*Member of* model.biblPart

*Contained by*

*core:* bibl

*namesdates:* listEvent listNym listOrg listPerson listPlace

*May contain*

*core:* p

*linking:* ab

*namesdates:* relation

*Declaration*

```

element listRelation
{
 att.global.attributes,

```

```

 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.typed.attributes,
 att.sortable.attributes,
 (model.pLike+ | relation+)
}

```

*Example*

```

<listPerson>
 <person xml:id="pp1">
<!-- data about person pp1 -->
 </person>
 <person xml:id="pp2">
<!-- data about person pp1 -->
 </person>
<!-- more person (pp3, pp4) elements here -->
</listPerson>
<listRelation type="personal">
 <relation name="parent" active="#pp1 #pp2" passive="#pp3 #pp4"/>
 <relation name="spouse" mutual="#pp1 #pp2"/>
</listRelation>
<listRelation type="social">
 <relation name="employer" active="#pp1" passive="#pp3 #pp5 #pp6 #pp7"/>
</listRelation>

```

The persons with identifiers pp1 and p2 are the parents of pp3 and pp4; they are also married to each other; pp1 is the employer of pp3, pp5, pp6, and pp7.

*Example*

```

<listRelation>
 <p>All speakers are members of the Ceruli family, born in Naples.</p>
</listRelation>

```

*Note* May contain a prose description organized as paragraphs, or a sequence of <relation> elements.

---

**<listTranspose>** supplies a list of transpositions, each of which is indicated at some point in a document typically by means of metamarks. [11.3.4.5. *Transpositions*]

*Module* transcr — Representation of Primary Sources

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of* model.global.meta model.profileDescPart

}
```

### Example

```
<listTranspose>
 <transpose>
 <ptr target="#ib02"/>
 <ptr target="#ib01"/>
 </transpose>
</listTranspose>
```

This example might be used for a source document which indicates in some way that the elements identified by `ib02` and code `ib01` should be read in that order (`ib02` followed by `ib01`), rather than in the reading order in which they are presented in the source.

**<listWit>** (witness list) lists definitions for all the witnesses referred to by a critical apparatus, optionally grouped hierarchically. [12.1. The Apparatus Entry, Readings, and Witnesses]

*Module* textcrit — Critical Apparatus

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.sortable (@sortKey)

*Member of* model.listLike

 musicNotation origin provenance source support surrogates

*spoken:* writing

*textcrit:* lem listWit rdg witness

*textstructure:* argument back body div div1 div2 div3 div4 div5 div6 div7 docEdition epigraph imprimatur  
 postscript signed titlePart

*transcr:* damage metamark mod restore retrace supplied surplus

*verse:* rhyme

*May contain*

*core:* head

*textcrit:* listWit witness

*Declaration*

```

element listWit
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.sortable.attributes,
 (model.headLike?, (witness | listWit)+)
}

```

*Example*

```

<listWit>
 <witness xml:id="HL26">Ellesmere, Huntingdon Library 26.C.9</witness>
 <witness xml:id="PN392">Hengwrt, National Library of Wales,
 Aberystwyth, Peniarth 392D</witness>
 <witness xml:id="RP149">Bodleian Library Rawlinson Poetic 149
 (see further <ptr target="#MSRP149"/>)</witness>
</listWit>

```

*Note* May contain a series of <witness> or <listWit> elements. The provision of a <listWit> element simplifies the automatic processing of the apparatus, e.g. the reconstruction of the readings for all witnesses from an

exhaustive apparatus.

Situations commonly arise where there are many more or less fragmentary witnesses, such that there may be quite distinct groups of witnesses for different parts of a text or collection of texts. Such groups may be given separately, or nested within a single <listWit> element at the beginning of the file listing all the witnesses, partial and complete, for the text, with the attestation of fragmentary witnesses indicated within the apparatus by use of the <witStart> and <witEnd> elements described in section 12.1.5. *Fragmentary Witnesses*. Note however that a given witness can only be defined once, and can therefore only appear within a single <listWit> element.

---

**<locale>** contains a brief informal description of the kind of place concerned, for example: a room, a restaurant, a park bench, etc. [15.2.3. *The Setting Description*]

*Module* corpus — Language Corpora

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

 <offset>beyond</offset>
 <placeName>The Pillars of <persName>Hercules</persName>
 </location>
</place>
```

**<locus>** defines a location within a manuscript or manuscript part, usually as a (possibly discontinuous) sequence of folio references. [10.3.5. *References to Locations within a Manuscript*]

Module msdescription — Manuscript Description

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.pointing (@targetLang,  
 @target, @evaluate)

@scheme identifies the foliation scheme in terms of which the location is being specified.

Status Optional

Datatype data.pointer

Values A pointer to some <foliation> element which defines the foliation scheme used, or an external link to some equivalent resource.

@from specifies the starting point of the location in a normalized form.

Status Optional

Datatype data.word

Values typically this will be a page number

@to specifies the end-point of the location in a normalized form.

Status Optional

*Datatype* `data.word`

*Values* typically this will be a page number

*Member of* model.pPart.msdesc

*Contained by*

*transcr:* damage fw metamark mod restore retrace supplied surplus

*verse:* metSym rhyme

*May contain*

*gaiji:* g

*Declaration*

```

element locus
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.pointing.attributes,
 attribute scheme { data.pointer }?,
 attribute from { data.word }?,
 attribute to { data.word }?,
 macro.xtext}

```

*Example*

```

<!-- within ms description --><msItem n="1">
 <locus target="#F1r #F1v #F2r" from="1r" to="2r">ff. 1r-2r</locus>
 <author>Ben Jonson</author>
 <title>Ode to himself</title>
 <rubric rend="italics"> An Ode<lb/> to him selfe.</rubric>
 <incipit>Com leaue the loathed stage</incipit>
 <explicit>And see his chariot triumph ore his wayne.</explicit>
 <bibl>
 <name>Beal</name>, <title>Index 1450-1625</title>, JnB 380</bibl>
 </msItem>
<!-- within transcription ... -->
<pb xml:id="F1r"/>
<!-- ... -->
<pb xml:id="F1v"/>
<!-- ... -->
<pb xml:id="F2r"/>
<!-- ... -->

```

*Example* The `fac` attribute is available globally when the `transcr` module is included in a schema. It may be used to point directly to an image file, as in the following example:

```

<msItem>
 <locus
 facs="images/08v.jpg images/09r.jpg images/09v.jpg images/10r.jpg images/10v.jpg">fols.
 8v-10v</locus>
 <title>Birds Praise of Love</title>
 <bibl>
 <title>IMEV</title>
 <biblScope>1506</biblScope>
 </bibl>
</msItem>

```

*Note* The `target` attribute should only be used to point to elements that contain or indicate a transcription of the locus being described, as in the first example above. To associate a <locus> element with a page image or other comparable representation, the global `fac` attribute should be used instead, as shown in the second example. Use of the `target` attribute to indicate an image is strongly deprecated. The `fac` attribute may be used to indicate one or more image files, as above, or alternatively it may point to one or more appropriate XML elements, such as the <surface>, <zone> element, <graphic>, or <binaryObject> elements.

---

**<locusGrp>** groups a number of locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation. [10.3.5. *References to Locations within a Manuscript*]

*Module* msdescription — Manuscript Description

*Attributes* `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@rend`, `@style`, `@rendition`, `@xml:base`, `@xml:space`)  
 (`att.global.linking` (`@corresp`, `@synch`, `@sameAs`, `@copyOf`, `@next`, `@prev`, `@exclude`, `@select`))  
 (`att.global.analytic` (`@ana`)) (`att.global.facs` (`@facs`)) (`att.global.change` (`@change`))

`@scheme` identifies the foliation scheme in terms of which all the locations contained by the group are specified.

*Status* Optional

*Datatype* data.pointer

*Values* A pointer to some <foliation> element which defines the foliation scheme used, or an external link to some equivalent resource.

---

**<memberOf>** specifies class membership of the documented element or class. [22.4.3. *Classification of Components*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@key specifies the identifier for a class of which the documented element or class is a member or subclass

*Status* Optional

*Datatype* data.name

@mode specifies the effect of this declaration on its parent module.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **add** this declaration is added to the current definitions[Default]

**delete** this declaration and all of its children are removed from the current setup

@max supplies the maximum number of times the element can occur in elements which use this model class in their content model

*Status* Optional

*Datatype* data.numeric

@min supplies the minimum number of times the element must occur in elements which use this model class in their content model

*Status* Optional

*Datatype* data.numeric

*Member of* ~~defined by~~

*tagdocs:* classes

*May contain*

*gaiji:* g  
*Declaration*

```

element memberOf
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute key { data.name }?,
 attribute mode { "add" | "delete" }?,
 attribute max { data.numeric }?,
 attribute min { data.numeric }?,
 macro.xtext}

```

*Example*

```

<memberOf key="model.divLike"/>
<memberOf key="att.identified"/>

```

This element will appear in any content model which references model.divLike, and will have attributes defined in att.identified (in addition to any defined explicitly for this element).

*Note* Elements or classes which are members of multiple (unrelated) classes will have more than one <memberOf> element, grouped by a <classes> element. If an element is a member of a class C1, which is itself a subclass of a class C2, there is no need to state this, other than in the documentation for class C1. Any additional comment or explanation of the class membership may be provided as content for this element.

<metDecl> (metrical notation declaration) documents the notation employed to represent a metrical pattern when

this is specified as the value of a met, real, or rhyme attribute on any structural element of a metrical text (e.g. <lg>, <l>, or <seg>). [6.5. Metrical Notation Declaration 6.3. Rhyme and Metrical Analysis]

*Module* verse — Verse

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.declarable (@default)  
 @type indicates whether the notation conveys the abstract metrical form, its actual prosodic

realization, or the rhyme scheme, or some combination thereof.

*Status* Optional

*Datatype* 1–3 occurrences of `data.enumerated` separated by whitespace

*Legal values are:* **met** (met attribute) declaration applies to the abstract metrical form recorded on the met attribute

**real** (real attribute) declaration applies to the actual realization of the conventional metrical structure recorded on the real attribute

**rhyme** (rhyme attribute) declaration applies to the rhyme scheme recorded on the rhyme attribute

*Note* By default, the <metDecl> element documents the notation used for metrical pattern and realization. It may also be used to document the notation used for rhyme scheme information; if not otherwise documented, the rhyme scheme notation defaults to the traditional ‘abab’ notation.

@pattern (regular expression pattern) specifies a regular expression defining any value that is legal for this notation.

*Status* Optional

*Datatype* `data.pattern`

*Values* the value must be a valid regular expression per the World Wide Web Consortium's XML Schema Part 2: Datatypes Second Edition, Appendix F

*Member of* model.encodingDescPart

*Contained by*

*header:* encodingDesc

*May contain*

*core:* note p

*linking:* ab

*textcrit:* witDetail

*verse:* metSym

*Declaration*

```

element metDecl
{
 att.global.attributes,
 att.global.linking.attributes,

 ("met" | "real" | "rhyme")?
 }
 }
}

```

```

 }?,
 attribute pattern { data.pattern }?,
 ((model.pLike | model.noteLike)+ | metSym+)
 }

```

*Example*

```

<metDecl xml:id="ip" type="met" pattern="((SU|US)USUSUSUS/)">
 <metSym value="S">stressed syllable</metSym>
 <metSym value="U">unstressed syllable</metSym>
 <metSym value="/">metrical line boundary</metSym>
</metDecl>

```

This example is intended for the far more restricted case typified by the Shakespearean iambic pentameter. Only metrical patterns containing exactly ten syllables, alternately stressed and unstressed, (except for the first two which may be in either order) to each metrical line can be expressed using this notation.

*Note* The encoder may choose whether to define the notation formally or informally. However, the two methods may not be mixed. That is, <metDecl> may contain either a sequence of <metSym> elements or, alternately, a series of paragraphs or other components. If the pattern attribute is specified and <metSym> elements are used, then all the codes appearing within the pattern attribute should be documented. Only usable within the header if the verse module is used.

**<metSym>** (metrical notation symbol) documents the intended significance of a particular character or character sequence within a metrical notation, either explicitly or in terms of other symbol elements in the same metDecl. [6.5. Metrical Notation Declaration]

*Module* verse — Verse

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@value specifies the character or character sequence being documented.

*Status* Required

*Datatype* 1–∞ occurrences of `data.word` separated by whitespace

@terminal specifies whether the symbol is defined in terms of other symbols (terminal is set to false) or in prose (terminal is set to true).

*Status* Optional

*Datatype* `data.truthValue`

*Default* true

*Note* The value true indicates that the element contains a prose definition of its meaning; the value false indicates that the element contains a definition of its meaning given using symbols defined elsewhere in the same <metDecl> element.

**<moduleRef>** (module reference) references a module which is to be incorporated into a schema. [22.2. *Modules and Schemas*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.readFrom (@source) @prefix specifies a default prefix which will be prepended to all patterns from the imported module

*Status* Optional

*Datatype* 0–1 occurrences of `data.xmlName` separated by whitespace

*Schematron* <s:rule context="tei:moduleRef"> <s:report test="//\*[ not( generate-id(.) eq generate-id( current() ) ) ]/@prefix = @prefix">The prefix attribute of <s:name/> should not match that of any other element (it would defeat the purpose)</s:report></s:rule>

*Note* Use of this attribute avoids name collisions (and thus invalid schemas) when the external schema being mixed in with TEI uses a name the TEI or some other included external schema already uses for a pattern.

@include supplies a list of the elements which are to be copied from the specified module into the schema being defined.

*Status* Optional

*Datatype* 0–∞ occurrences of `data.xmlName` separated by whitespace

**@except** supplies a list of the elements which are not to be copied from the specified module into the schema being defined.

*Status* Optional

*Datatype* 0–∞ occurrences of `data.xmlName` separated by whitespace

**@key** the name of a TEI module

*Status* Optional

*Datatype* `data.xmlName`

**@url** (uniform resource locator) refers to a non-TEI module of RELAX NG code by external location

*Status* Optional

*Datatype* `data.pointer`

*Member of* model.oddRef

*Contained by*

*tagdocs:* schemaSpec specGrp

*May contain*

*tagdocs:* content

*Declaration*

```

element moduleRef
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.readFrom.attributes,
 attribute prefix { data.xmlName }?
 >>
 tei:constraintSpec
 [
 scheme = "isoschematron"
 ident = "not-same-prefix"
 " "
 "The prefix attribute of "
 " should not match that of any other element (it would defeat the purpose)"
],
 (
 attribute include { list { data.xmlName* } }?
 | attribute except { list { data.xmlName* } }?
),
 (attribute key { data.xmlName }? | attribute url { data.pointer }?),
 content?
}

```

*Schematron* `<s:rule context="tei:moduleRef"> <s:report test="* and @key">Child elements of <s:name/> are only allowed when an external module is being loaded </s:report></s:rule>`

*Example*

```
<moduleRef key="linking"/>
```

This includes all objects available from the linking module.

*Example*

```
<moduleRef key="linking" exclude="linkGrp link"/>
```

This includes all objects available from the linking module except for the `<link>` and `<linkGrp>` elements.

*Example*

```
<moduleRef key="linking" exclude="linkGrp link"/>
```

This includes all objects available from the linking module except for the <link> and <linkGrp> elements.

*Example*

```
<moduleRef key="linking" include="linkGrp link"/>
```

This includes only the <link> and <linkGrp> elements from the linking module.

*Note* If neither include nor exclude is supplied, the effect of this element is to make all the declarations contained by the referenced module available to the schema being compiled. If both attributes are supplied, an ODD processor should signal an error. A TEI module is identified by the name supplied as value for the ident attribute on a <moduleSpec> element. The source attribute may be used to specify an online source from which the specification of that module may be read. A URI may alternatively be supplied in the case of a non-TEI module, and this is expected to be written as a RELAX NG schema.

---

**<moduleSpec>** (module specification) documents the structure, content, and purpose of a single module, i.e. a named and externally visible group of declarations. [22.2. *Modules and Schemas*]

```

*Note* This element is synonymous with <gram type="mood">.

**<move/>** (movement) marks the actual entrance or exit of one or more characters on stage. [7.2.4. Stage Directions]

*Module* drama — Performance Texts

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.ascribed (@who)  
 @type characterizes the movement, for example as an entrance or exit.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **entrance** character is entering the stage.

**exit** character is exiting the stage.

**onStage** character moves on stage

@where specifies the direction of a stage movement.

*Status* Optional

*Datatype* 1–∞ occurrences of data.enumerated separated by whitespace

*Sample values include:* **L** (left) stage left

**R** (right) stage right

**C** (center) centre stage

*Note* Full blocking information will normally require combinations of values, (for example ‘UL’ for ‘upper stage left’) and may also require more detailed encoding of speed, direction etc. Full documentation of any coding system used should be provided in the header.

**@perf** (performance) identifies the performance or performances in which this movement occurred as specified.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* The references are derived from the `xml:id` attribute on a `<performance>` element.

*Member of* `model.stageLike`

*Contained by*

*core:* `add corr del desc emph head hi item l lg meeting note orig p q quote ref reg said sic sp stage title unclear`

<persName>
 <forename>Frederick</forename>
 <nameLink>van der</nameLink>
 <surname>Tronck</surname>
</persName>

```

*Example*

```

<persName>
 <forename>Alfred</forename>
 <nameLink>de</nameLink>
 <surname>Musset</surname>
</persName>

```

---

**<namespace>** supplies the formal name of the namespace to which the elements documented by its children belong. [2.3.4. *The Tagging Declaration*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
 @name specifies the full formal name of the namespace concerned.

*Status* Required

*Datatype* data.namespace

*Member of* ~~Confined by~~

*header:* tagsDecl

*May contain*

*header:* tagUsage

*Declaration*

```

element namespace
{

---

**<node>** encodes a node, a possibly labeled point in a graph. [19.1. *Graphs and Digraphs*]

*Module* nets — Graphs, Networks, and Trees

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@value provides the value of a node, which is a feature structure or other analytic element.

*Status* Optional

*Datatype* data.pointer

@type provides a type for a node.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **initial** initial node in a transition network

**final** final node in a transition network

```
<graph>
 <node
 xml:id="gnex11"
 adjTo="#gnex12"
 adj="#gnex13"
 type="initial">
 <label>1</label>
 </node>
 <node
 xml:id="gnex12"
 adjFrom="#gnex11"
 adjTo="#gnex13">
 <label>2</label>
 </node>
 <node
 xml:id="gnex13"
 adjFrom="#gnex12"
 adj="#gnex11"
 type="final">
 <label>3</label>
 </node>
</graph>
```

@adjTo (adjacent to) gives the identifiers of the nodes which are adjacent to the current node.

*Status* Optional

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

```
<graph>
 <node
 xml:id="gnex21"
 adjTo="#gnex22"
 adj="#gnex23"
 type="initial">
 <label>1</label>
 </node>
 <node
 xml:id="gnex22"
 adjTo="#gnex23">
 <label>2</label>
 </node>
 <node
 xml:id="gnex23"
 type="final">
 <label>3</label>
 </node>
</graph>
```

@adjFrom (adjacent from) gives the identifiers of the nodes which are adjacent from the current node.

*Status* Optional

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

```
<graph>
 <node
 xml:id="gnex31"
 type="initial">
 <label>1</label>
 </node>
```

```
<node
 xml:id="gnex32"
 adjFrom="#gnex31">
 <label>2</label>
</node>
<node
 xml:id="gnex33"
 adjFrom="#gnex32"
 adj="#gnex31"
 type="final">
 <label>3</label>
</node>
</graph>
```

**@adj** (adjacent) gives the identifiers of the nodes which are both adjacent to and adjacent from the current node.

*Status* Optional

*Datatype* 1– $\infty$  occurrences of `data.pointer` separated by whitespace

```
<graph>
 <node
 xml:id="gnex41"
 adj="#gnex42 #gnex43"
 type="initial">
 <label>1</label>
 </node>
 <node
 xml:id="gnex42"
 adj="#gnex41 #gnex43">
 <label>2</label>
 </node>
 <node
 xml:id="gnex43"
 adj="#gnex42 #gnex41"
 type="final">
 <label>3</label>
 </node>
</graph>
```

*Note* Use this attribute instead of the `adjTo` and `adjFrom` attributes when the graph is undirected and vice versa if the graph is directed.

**@inDegree** gives the in degree of the node, the number of nodes which are adjacent from the given node.

*Status* Optional

*Datatype* `data.count`

```
<graph>
 <node
 xml:id="gnex51"
 adjTo="#gnex52"
 adj="#gnex53"
 inDegree="1"
 type="initial">
 <label>1</label>
 </node>
 <node
 xml:id="gnex52"
 adjFrom="#gnex51"
 adjTo="#gnex53"
 inDegree="2">
 <label>2</label>
```

```

</node>
<node
 xml:id="gnex53"
 adjFrom="#gnex52"
 adj="#gnex51"
 inDegree="2"
 type="final">
 <label>3</label>
</node>
</graph>

```

@outDegree gives the out degree of the node, the number of nodes which are adjacent to the given node.

*Status* Optional

*Datatype* data.count

```

<graph>
 <node
 xml:id="gnex61"
 adjTo="#gnex62"
 adj="#gnex63"
 outDegree="2"
 type="initial">
 <label>1</label>
 </node>
 <node
 xml:id="gnex62"
 adjFrom="#gnex61"
 adjTo="#gnex63"
 outDegree="1">
 <label>2</label>
 </node>
 <node
 xml:id="gnex63"
 adjFrom="#gnex62"
 adj="#gnex61"
 outDegree="2"
 type="final">
 <label>3</label>
 </node>
</graph>

```

@degree gives the degree of the node, the number of arcs with which the node is incident.

*Status* Optional

*Datatype* data.count

```

<graph>
 <node
 xml:id="gnex71"
 adjTo="#gnex72"
 adj="#gnex73"
 outDegree="1"
 inDegree="0"
 degree="1"
 type="initial">
 <label>1</label>
 </node>
 <node
 xml:id="gnex72"
 adjFrom="#gnex71"
 adjTo="#gnex73"

```

```

 outDegree="1"
 inDegree="1"
 degree="0">
 <label>2</label>
 </node>
 <node
 xml:id="gnex73"
 adjFrom="#gnex72"
 adj="#gnex71"
 outDegree="0"
 inDegree="1"
 degree="1"
 type="final">
 <label>3</label>
 </node>
</graph>

```

*Note* Use this attribute instead of the inDegree and outDegree attributes when the graph is undirected and vice versa if the graph is directed.

*Member of*

*nets:* graph

*May contain*

*core:* label

*Declaration*

```

element node
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute value { data.pointer }?,
 attribute type { "initial" | "final" | xsd:Name }?,
 attribute adjTo { list { data.pointer+ } }?,
 attribute adjFrom { list { data.pointer+ } }?,
 attribute adj { list { data.pointer+ } }?,
 attribute inDegree { data.count }?,
 attribute outDegree { data.count }?,
 attribute degree { data.count }?,
 (label, label?)?
}

```

*Example*

```

<node
 xml:id="t6"
 type="final"
 inDegree="2"
 outDegree="0">
 <label>6</label>
</node>

```

*Note* Zero, one, or two children <label> elements may be present. The first occurrence of <label> provides a label for the arc; the second provides a second label for the arc, and should be used if a transducer is being encoded whose actions are associated with nodes rather than with arcs.

**<normalization>** indicates the extent of normalization or regularization of the original source carried out in converting it to electronic form. [2.3.3. *The Editorial Practices Declaration* 15.3.2. *Declarable Elements*]

*Module header* — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.declarable (@default)  
 @source indicates the authority for any normalization carried out.

*Status* Optional

*Datatype* data.pointer

*Values* Points to a bibliographic description or other resource documenting the principles underlying the normalization which has been applied.

@method indicates the method adopted to indicate normalizations within the text.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **silent** normalization made silently [Default]

**markup** normalization represented using markup

*Member of* model.editorialDeclPart

 (model.labelLike | model.ptrLike | graphic | binaryObject) *
}

```

*Example*

```

<notatedMusic>
 <ptr target="bar1.xml"/>
 <graphic url="bar1.jpg"/>
 <desc>First bar of Chopin's Scherzo No.3 Op.39</desc>
</notatedMusic>

```

*Note* It is possible to describe the content of the notation using elements from the `model.labelLike` class and it is possible to point to an external representation using elements from `model.ptrLike`. It is possible to specify the location of digital objects representing the notated music in other media such as images or audio-visual files. The encoder's interpretation of the correspondence between the notated music and these digital objects is not encoded explicitly. We recommend the use of `graphic` and `binaryObject` mainly as a fallback mechanism when the notated music format is not displayable by the application using the encoding. The alignment of encoded notated music, images carrying the notation, and audio files is a complex matter for which we refer the encoder to other formats and specifications such as MPEG-SMR.

**<note>** contains a note or annotation. [3.8.1. Notes and Simple Annotation 2.2.6. The Notes Statement 3.11.2.8. Notes and Statement of Language 9.3.5.4. Notes within Entries]

*Module* core — Elements Available in All TEI Documents

*Attributes* `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@rend`, `@style`, `@rendition`, `@xml:base`, `@xml:space`)  
`(att.global.linking` (`@corresp`, `@synch`, `@sameAs`, `@copyOf`, `@next`, `@prev`, `@exclude`, `@select`))  
`(att.global.analytic` (`@ana`)) `(att.global.facs` (`@facs`)) `(att.global.change` (`@change`)) `att.placement` (`@place`)  
`att.pointing` (`@targetLang`, `@target`, `@evaluate`) `att.responsibility` (`@cert`, `@resp`) `att.typed` (`@type`, `@subtype`)  
`@anchored` indicates whether the copy text shows the exact place of reference for the note.

*Status* Optional

*Datatype* `data.truthValue`

*Default* true

*Note* In modern texts, notes are usually anchored by means of explicit footnote or endnote symbols. An explicit indication of the phrase or line annotated may however be used instead (e.g. 'page 218, lines 3–4'). The anchored attribute indicates whether any explicit location is given, whether by symbol or by prose cross-reference. The value true indicates that such an explicit location is indicated in the copy text; the value false indicates that the copy text does not indicate a specific place of attachment for the note. If the specific symbols used in the copy text at the location the note is anchored are to be recorded, use the `n` attribute.

`@targetEnd` points to the end of the span to which the note is attached, if the note is not embedded in the text at that point.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Values* reference to the `xml:id(s)` of element(s) which *end* at the location(s) in question, or to an empty element at the point in question.

*Note* This attribute is retained for backwards compatibility; it may be removed at a subsequent release of the Guidelines. The recommended way of pointing to a span of elements is by means of the `range` function of XPointer, as further described in 16.2.5.4. `range()`.

 att.typed.attributes,
 attribute anchored { data.truthValue }?,
 attribute targetEnd { list { data.pointer+ } }?,
 macro.specialPara}

```

*Example* In the following example, the translator has supplied a footnote containing an explanation of the term translated as "painterly":

And yet it is not only  
in the great line of Italian renaissance art, but even in the  
painterly <note place="bottom" type="gloss" resp="#MDMH">  
 <term xml:lang="de">Malerisch</term>. This word has, in the German, two  
distinct meanings, one objective, a quality residing in the object,  
the other subjective, a mode of apprehension and creation. To avoid  
confusion, they have been distinguished in English as  
<mentioned>picturesque</mentioned> and  
<mentioned>painterly</mentioned> respectively.  
</note> style of the  
Dutch genre painters of the seventeenth century that drapery has this  
psychological significance.

For this example to be valid, the code MDMH must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header:

```

<respStmt xml:id="MDMH">
 <resp>translation from German to English</resp>

```

```
<name>Hottinger, Marie Donald Mackie</name>
</respStmt>
```

*Example* The global `n` attribute may be used to supply the symbol or number used to mark the note's point of attachment in the source text, as in the following example:

```
Mevorakh b. Saadya's mother, the matriarch of the
family during the second half of the eleventh century, <note n="126" anchored="true"> The
alleged mention of Judah Nagid's mother in a letter from 1071 is, in fact, a reference to
Judah's children; cf. above, nn. 111 and 54. </note> is well known from Geniza documents
published by Jacob Mann.
```

However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

---

**<notesStmt>** (notes statement) collects together any notes providing information about a text additional to that recorded in other parts of the bibliographic description. [2.2.6. *The Notes Statement* 2.2. *The File Description*]

*Module* header — The TEI Header

 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.ranging (@atLeast,  
 @atMost, @min, @max, @confidence)

@type indicates the type of numeric value.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **cardinal** absolute number, e.g. 21, 21.5

**ordinal** ordinal number, e.g. 21st

**fraction** fraction, e.g. one half or three-quarters

**percentage** a percentage

*Note* If a different typology is desired, other values can be used for this attribute.

@value supplies the value of the number in standard form.

*Status* Optional

*Datatype* data.numeric

*Values* a numeric value.

*Note* The standard form used is defined by the TEI datatype data.numeric.

</gramGrp>
</entry>

```

*Note* This element is synonymous with <gram type="num">.

**<numeric/>** (numeric value) represents the value part of a feature-value specification which contains a numeric value or range. [18.3. Other Atomic Feature Values]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.datcat (@datcat,  
 @valueDatcat)

@value supplies a lower bound for the numeric value represented, and also (if max is not supplied) its upper bound.

*Status* Required

*Datatype* data.numeric

@max supplies an upper bound for the numeric value represented.

*Status* Optional

*Datatype* data.numeric

@trunc specifies whether the value represented should be truncated to give an integer value.

*Status* Optional

*Datatype* data.truthValue

*Member of* model.featureVal.single

*Contained by*

*iso-fs:* f fvLib if vAlt vColl vDefault vLabel vMerge vNot vRange

*May contain* Empty element

*Declaration*

```

element numeric
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.datcat.attributes,
 attribute value { data.numeric },
 attribute max { data.numeric }?,
 attribute trunc { data.truthValue }?,
 empty
}

```

*Example*

```
<numeric value="42"/>
```

This represents the numeric value 42.

#### Example

```
<numeric value="42.45" max="50" trunc="true"/>
```

This represents any of the nine possible integer values between 42 and 50 inclusive. If the trunc attribute had the value FALSE, this example would represent any of the infinite number of numeric values between 42.45 and 50.0

*Note* It is an error to supply the max attribute in the absence of a value for the value attribute.

**<nym>** (canonical name) contains the definition for a canonical name or name component of any kind. [13.3.5. *Names and Nyms*]

*Module* namesdates — Names, Dates, People, and Places

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.typed (@type,  
 @subtype) att.sortable (@sortKey)  
 @parts points to constituent nyms

*Status* Optional

*Datatype* 1–∞ occurrences of `data.pointer` separated by whitespace

*Members defined by*

*namesdates:* listNym nym

*May contain*

*core:* p

*dictionaries:* colloc def etym form gramGrp hom hyph lbl orth pos pron re sense subc superEntry syll usg xr

*linking:* ab

*namesdates:* nym

*Declaration*

 att.sortable.attributes,
 attribute parts { list { data.pointer+ } }?,
 ((model.entryPart*), (model.pLike*), (nym*))
}
```

#### Example

```
<nym xml:id="J452">
 <form>
 <orth xml:lang="en-US">Ian</orth>
 <orth xml:lang="en-x-Scots">Iain</orth>
```

```
</form>
</nym>
```

**<objectDesc>** contains a description of the physical components making up the object which is being described.  
 [10.7.1. Object Description]

*Module* msdescription — Manuscript Description

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@form a short project-specific name identifying the physical form of the carrier, for example as a codex, roll, fragment, partial leaf, cutting etc.

*Status* Optional

*Datatype* data.enumerated

*Values* a short project-defined name

*Member of* model.physDescPart

*Contained by*

*msdescription:* physDesc

*May contain*

*core:* p

*linking:* ab

*msdescription:* layoutDesc supportDesc

*Declaration*

}
```

Example

```
<particDesc>
 <listPerson>
 <person xml:id="P-1234" sex="2" age="mid">
 <p>Female informant, well-educated, born in Shropshire
 UK, 12 Jan 1950, of unknown occupation.
 Speaks French fluently. Socio-Economic status B2.</p>
 </person>
 <person xml:id="P-4332" sex="1">
 <persName>
 <surname>Hancock</surname>
 <forename>Antony</forename>
 <forename>Aloysius</forename>
 <forename>St John</forename>
 </persName>
 <residence notAfter="1959">
 <address>
 <street>Railway Cuttings</street>
 <settlement>East Cheam</settlement>
 </address>
 </residence>
 <occupation>comedian</occupation>
 </person>
 <listRelation>
 <relation type="personal" name="spouse" mutual="#P-1234 #P-4332"/>
 </listRelation>
 </listPerson>
</particDesc>
```

This example shows both a very simple person description, and a very detailed one, using some of the more specialized elements from the module for Names and Dates.

*Note* May contain a prose description organized as paragraphs, or a structured list of persons and person groups, with an optional formal specification of any relationships amongst them.

*Declaration*

```
element pb
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
```

```

 att.global.change.attributes,
 att.typed.attributes,
 att.edition.attributes,
 att.spanning.attributes,
 att.breaking.attributes,
 empty
}

```

*Example* Page numbers may vary in different editions of a text.

```

<p> ... <pb n="145" ed="ed2"/>
<!-- Page 145 in edition "ed2" starts here --> ... <pb n="283" ed="ed1"/>
<!-- Page 283 in edition "ed1" starts here--> ... </p>

```

*Example* A page break may be associated with a facsimile image of the page it introduces by means of the `fac` attribute

```

<body>
 <pb n="1" facs="page1.png"/>
 <!-- page1.png contains an image of the page; the text it contains is encoded here -->
 <p>
 <!-- ... -->
 </p>
 <pb n="2" facs="page2.png"/>
 <!-- similarly, for page 2 -->
 <p>
 <!-- ... -->
 </p>
</body>

```

*Note* A `<pb>` element should appear at the start of the page which it identifies. The global `n` attribute indicates the number or other value associated with this page. This will normally be the page number or signature printed on it, since the physical sequence number is implicit in the presence of the `<pb>` element itself. The type attribute may be used to characterize the page break in any respect, for example as word-breaking or not.

---

**<pc>** (punctuation character) contains a character or string of characters regarded as constituting a single punctuation mark. [17.1. Linguistic Segment Categories]

*Module* analysis — Simple Analytic Mechanisms

*Attributes* `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@rend`, `@style`, `@rendition`, `@xml:base`, `@xml:space`)  
`(att.global.linking` (`@corresp`, `@synch`, `@sameAs`, `@copyOf`, `@next`, `@prev`, `@exclude`, `@select`))  
`(att.global.analytic` (`@ana`)) `(att.global.facs` (`@facs`)) `(att.global.change` (`@change`)) `att.segLike` (`@function`)  
`(att.metrical` (`@met`, `@real`, `@rhyme`)) `(att.datcat` (`@datcat`, `@valueDatcat`)) `(att.fragmentable` (`@part`))  
`att.typed` (`@type`, `@subtype`)

`@force` indicates the extent to which this punctuation mark conventionally separates words or phrases

*Status* Optional

*Datatype* `data.enumerated`

*Legal values are:* **strong** the punctuation mark is a word separator

**weak** the punctuation mark is not a word separator

**inter** the punctuation mark may or may not be a word separator

`@unit` provides a name for the kind of unit delimited by this punctuation mark.

*Status* Optional

*Datatype* `data.enumerated`

`@pre` indicates whether this punctuation mark precedes or follows the unit it delimits.

---

**<precision>** indicates the numerical accuracy or precision associated with some aspect of the text markup. [21.2.  
*Indications of Precision*]

*Module* certainty — Certainty, Precision, and Responsibility

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.scoping (@target,  
@match)

@degree indicates the degree of precision to be assigned as a value between 0 (none) and 1 (optimally  
precise)

*Status* Optional

*Datatype* data.probability

@precision characterizes the precision of the element or attribute pointed to by the <precision> element.

*Status* Optional

*Datatype* data.certainty

@stdDeviation supplies a standard deviation associated with the value in question

*Status* Optional

*Datatype* data.numeric

 att.datcat.attributes,
 empty
}

```

**<prefixDef>** (prefixing scheme used in data.pointer values) defines a prefixing scheme used in data.pointer values, showing how abbreviated URIs using the scheme may be expanded into full URIs. [16.2.3. Using Abbreviated Pointers]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.patternReplacement  
 (@matchPattern, @replacementPattern)  
 @ident supplies the identifier which functions as the prefix for an abbreviated pointing scheme such as  
 a private URI scheme. The prefix constitutes the text preceding the first colon.  
*Status* Required  
*Datatype* data.name  
*Values* an XML name

*Member of* defined by

*header:* listPrefixDef

*May contain*

*core:* p

*linking:* ab

*Declaration*

```

element prefixDef
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.patternReplacement.attributes,
 attribute ident { data.name },
 model.pLike*
}

```

*Example*

```

<prefixDef
 ident="ref"
 matchPattern="([a-z]+)"
 replacementPattern="../../references/references.xml#$1">
 <p> In the context of this project, private URIs with
 the prefix "ref" point to <gi>div</gi> elements in
 the project's global references.xml file.
 </p>
</prefixDef>

```

*Note* The abbreviated pointer may be dereferenced to produce either an absolute or a relative URI reference. In the latter case it is combined with the value of xml:base in force at the place where the cRef attribute occurs to form an absolute URI in the usual manner as prescribed by XML Base.

**<preparedness>** describes the extent to which a text may be regarded as prepared or spontaneous. [15.2.1. The Text Description]

*Module* corpus — Language Corpora

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type a keyword characterizing the type of preparedness.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **none** spontaneous or unprepared

**scripted** follows a script

**formulaic** follows a predefined set of conventions

**revised** polished or revised before presentation

*Member of* model.textDescPart

**<pron>** (pronunciation) contains the pronunciation(s) of the word. [9.3.1. Information on Written and Spoken Forms]

*Module* dictionaries — Dictionaries

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.lexicographic  
 (@expand, @norm, @split, @value, @orig, @location, @mergedIn, @opt) (att.datcat (@datcat, @valueDatcat))  
 @extent indicates whether the pronunciation is for whole word or part.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **full** (full form) [Default]

**pref** (prefix)

**suff** (suffix)

**part** (partial)

*Note*

@notation indicates what notation is used for the pronunciation, if more than one occurs in the machine-readable dictionary.

*Status* Optional

*Datatype* `data.enumerated`

*Values* Sample values: IPA, Murray, ...

</publicationStmt>

```

*Note* Where a publication statement contains several members of the mode.publicationStmtPart class rather than one or more paragraphs, care should be taken to ensure that the repeated elements are presented in a meaningful order. It is a conformance requirement that elements supplying information about publication place, address, identifier, availability, and date be given following the name of the publisher, distributor, or authority concerned, and preferably in that order. These constraints are not currently modelled in the schema, but may be in a future release.

---

**<publisher>** provides the name of the organization responsible for the publication or distribution of a bibliographic item. [3.11.2.4. *Imprint*, Size of a Document, and Reprint Information 2.2.4. *Publication*, Distribution, Licensing, etc.]

**<purpose>** characterizes a single purpose or communicative function of the text. [15.2.1. *The Text Description*]

*Module* corpus — Language Corpora

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type specifies a particular kind of purpose.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **persuade** didactic, advertising, propaganda, etc.

**express** self expression, confessional, etc.

**inform** convey information, educate, etc.

**entertain** amuse, entertain, etc.

@degree specifies the extent to which this purpose predominates.

*Status* Optional

*Datatype* data.certainty

*Note* Values should be interpreted as follows.

**high** this purpose is predominant

**medium** this purpose is intermediate

**low** this purpose is weak

**unknown** extent unknown

*Members defined by*

```

#### Example

It is spelled <q>Tübingen</q> – to enter the letter <q>u</q> with an umlaut hold down the <q>option</q> key and press <q>0 0 f c</q>

**Note** May be used to indicate that a passage is distinguished from the surrounding text for reasons concerning which no claim is made. When used in this manner, <q> may be thought of as syntactic sugar for <hi> with a value of rend that indicates the use of such mechanisms as quotation marks.

**<quotation>** specifies editorial practice adopted with respect to quotation marks in the original. [2.3.3. *The Editorial Practices Declaration* 15.3.2. *Declarable Elements*]

**Module** header — The TEI Header

**Attributes** att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.declarable (@default)  
 @marks (quotation marks) indicates whether or not quotation marks have been retained as content

within the text.

**Status** Optional

**Datatype** data.enumerated

**Legal values are:** **none** no quotation marks have been retained

**some** some quotation marks have been retained

**all** all quotation marks have been retained

@form specifies how quotation marks are indicated within the text.

**Deprecated** will be removed on 2014-04-28

**Status** Optional

**Datatype** data.enumerated

**Default** unknown

*Note* The form attribute is deprecated. Although retained for compatibility, this attribute will be removed at a subsequent release.

}

```

*Example* The following example from *Webster's New Collegiate Dictionary* (Springfield, Mass.: G. & C. Merriam Company, 1975) shows a single related entry for which no definition is given, since its meaning is held to be readily derivable from the root entry:

```

<entry>
 <form>
 <orth>neu·ral</orth>
 <pron>'n(y)ūr-əl</pron>
 </form>
 <gramGrp>
 <pos>adj</pos>
 </gramGrp>
 <sense n="1">
 <def>of, relating to, or affecting a nerve or the nervous system</def>
 </sense>
 <sense n="2"> ... </sense>
 <re>
 <form>
 <orth>neurally</orth>
 <pron extent="suffix">-ə-lē</pron>
 </form>
 <gramGrp>
 <pos>adv</pos>
 </gramGrp>
 </re>
</entry>

```

*Example* The following example from *Diccionario de la Universidad de Chicago Inglés-Español y Español-Inglés / The University of Chicago Spanish Dictionary, Fourth Edition, compiled by Carlos Castillo and Otto F. Bond* (Chicago: University of Chicago Press, 1987) shows a number of related entries embedded in the main entry. The original entry resembles the following:

abeja [a·bé·xa]*f.* bee;abejera [a·be·xé·ra]*f.* beehive;abejón [a·be·xóon]*m.* drone;  
bumblebee;abejorro [a·be·xó·rro]*m.* bumble bee.

One encoding for this entry would be:

```
<entry>
 <form>
 <orth>abeja</orth>
 </form>
 <gramGrp>
 <gen>f. </gen>
 </gramGrp>
 <sense n="1.">
 <usg type="domain"> (ento.) </usg>
 <def> bee </def>. </sense>
 <sense n="2.">
 <def> busy bee, hard worker </def>. </sense>
 <sense n="3.">
 <usg orig="A." type="domain"> (astron.) </usg>, <def> Musca </def> – </sense>
 <re>
 <form>
 <orth orig="a. albanila"> abeja albanila </orth>, </form>
 <sense>
 <def>mason bee</def>;</sense>
 </re>
 <re>
 <form>
 <orth orig="a. carpintera"> abeja carpintera </orth>, </form>
 <sense>
 <def>carpenter bee </def>;</sense>
 </re>
 <re>
 <form>
 <orth xml:id="re-o3" orig="a. reina or maestra"> abeja reina </orth>
 <orth mergedIn="#re-o4"> abeja maestra </orth>
 </form>
 <sense>
 <def> queen bee </def>;</sense>
 </re>
 <re>
 <form>
 <orth xml:id="re-o4" orig="a. neutra or obrera"> abeja neutra </orth>
 <orth mergedIn="#re-o3"> abeja obrera </orth>
 </form>
 <sense>
 <def>worker bee</def>.</sense>
 </re>
</entry>
```

*Example* In the much larger Simon & Schuster Spanish-English dictionary (*Tana de Gámez, ed., Simon and Schuster's International Dictionary* (New York: Simon and Schuster, 1973).) these derived forms of *abeja* are treated as separate main entries, but there are other embedded phrases shown as <re>s in its main entry for *abeja*:

abeja, *f.* 1. (ento.) bee. 2. busy bee, hard worker. 3. (astron.) A., Musca. — a. albanila, mason bee; a. carpintera, carpenter bee; a. reina or maestra, queen bee; a. neutra or obrera, worker bee.

This entry may be encoded thus:

```

<entry>
 <form>
 <orth>abeja</orth>
 </form>
 <gramGrp>
 <gen>f.</gen>
 </gramGrp>
 <sense n="1.">
 <usg type="domain">(ento.)</usg>
 <def>bee</def>. </sense>
 <sense n="2.">
 <def>busy bee, hard worker</def>. </sense>
 <sense n="3.">
 <usg orig="A." type="domain">(astron.)</usg>, <def>Musca</def> – </sense>
 <re>
 <form>
 <orth orig="a. albanila">abeja albanila</orth>, </form>
 <sense>
 <def>mason bee</def>; </sense>
 </re>
 <re>
 <form>
 <orth orig="a. carpintera">abeja carpintera</orth>, </form>
 <sense>
 <def>carpenter bee</def>; </sense>
 </re>
 <re>
 <form>
 <orth xml:id="re-o1" orig="a. reina or maestra">abeja reina</orth>
 <orth mergedIn="#re-o1">abeja maestra</orth>
 </form>
 <sense>
 <def>queen bee</def>; </sense>
 </re>
 <re>
 <form>
 <orth xml:id="re-o2" orig="a. neutra or obrera">abeja neutra</orth>
 <orth mergedIn="#re-o2">abeja obrera</orth>
 </form>
 <sense>
 <def>worker bee</def>. </sense>
 </re>
</entry>

```

*Note* May contain character data mixed with any other elements defined in the dictionary tag set. Identical in sub-elements to an <entry> tag, and used where a dictionary has embedded information inside one entry which could have formed a separate entry. Some authorities distinguish related entries, run-on entries, and various other types of degenerate entries; no such typology is attempted here.

**<recordHist>** (recorded history) provides information about the source and revision status of the parent manuscript description itself. [10.9.1. *Administrative information*]

 spanTo="#anchor-1"
 hand="#g_bl"/>Ihr hagren, triften, krummgezog<mod rend="strikethrough">nen</mod>ener Nacken
 </line>
<line>Wenn ihr nur piepfet ift die Welt fchon matt.<anchor xml:id="anchor-1"/>
</line>

```

This encoding represents the following sequence of events:

- "Ihr hagren, triften, krummgezog nenener Nacken/ Wenn ihr nur piepfet ift die Welt fchon matt." is written
- the redundant letters "nen" in "nenener" are deleted
- the whole passage is deleted by hand g\_bl using strikethrough
- the deletion is reasserted by another hand (identified here as g\_t)

**<ref>** (reference) defines a reference to another location, possibly modified by additional text or comment. [3.6. *Simple Links and Cross-References* 16.1. *Links*]

sentence</ref>
```

*Example*

```
See also <ref target="#locution">s.v. <term>locution</term>
</ref>.
```

*Note* The target and cRef attributes are mutually exclusive.

**<refsDecl>** (references declaration) specifies how canonical references are constructed for this text. [2.3.6.3.

*Milestone Method 2.3. The Encoding Description 2.3.6. The Reference System Declaration]*

*Module header* — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.declarable (@default)

*Member of* model.encodingDescPart

*Contained by*

*header:* encodingDesc

*May contain*

*core:* p

*header:* cRefPattern refState

*linking:* ab

*Declaration*

```
element refsDecl
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.declarable.attributes,
 (model.pLike+ | cRefPattern+ | refState+)
}
```

*Example*

```
<refsDecl>
 <cRefPattern
 matchPattern="([A-Za-z0-9]+) ([0-9]+):([0-9]+)"
```

```
replacementPattern="#xpath(//body/div[@n='$1']/div[$2]/div3[$3])"/>
</refsDecl>
```

This example is a formal representation for the referencing scheme described informally in the following example.

Example

```
<refsDecl>
 <p>References are made up by concatenating the value for the
 <att>n</att> attribute on the highest level <gi>div</gi>
 element, followed by a space, followed by the sequential
 number of the next level <gi>div</gi> followed by a colon
 followed by the sequential number of the next (and lowest)
 level <gi>div</gi>.</p>
</refsDecl>
```

**<refState/>** (reference state) specifies one component of a canonical reference defined by the milestone method.  
[2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration]

Module header — The TEI Header

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.milestoneUnit (@unit)  
att.edition (@ed, @edRef)

@length specifies the fixed length of the reference component.

Status Optional

Datatype data.count

Values If no value is provided, the length is unlimited and goes to the next delimiter or to the end of the value.

Note When constructing a reference, if the reference component found is of numeric type, the length is made up by inserting leading zeros; if it is not, by inserting trailing blanks. In either case, reference components are truncated if necessary at the right hand side. When seeking a reference, the length indicates the number of characters which should be compared. Values longer than this will be regarded as matching, if they start correctly.

@delim (delimiter) supplies a delimiting string following the reference component.

Status Optional

Datatype data.text

Values If a single space is used it is interpreted as whitespace.

 <extent>78 p.</extent>
</monogr>
</biblStruct>
</relatedItem>
</biblStruct>

```

*Note* If the target attribute is used to reference the related bibliographic item, the element should be empty.

**<relation>** (relationship) describes any kind of relationship or linkage amongst a specified group of places, events, persons, objects or other items. [13.3.2.3. *Personal Relationships*]

*Module* namesdates — Names, Dates, People, and Places

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.dataable (@calendar,  
 @period) (att.dataable.w3c (@when, @notBefore, @notAfter, @from, @to)) (att.dataable.iso (@when-iso,  
 @notBefore-iso, @notAfter-iso, @from-iso, @to-iso)) (att.dataable.custom (@when-custom, @notBefore-custom,  
 @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod)) att.editLike (@evidence,  
 @source, @instant) (att.dimensions (@unit, @quantity, @extent, @precision, @scope) (att.ranging (@atLeast,  
 @atMost, @min, @max, @confidence))) (att.responsibility (@cert, @resp)) att.canonical (@key, @ref)  
 att.sortable (@sortKey)

@type categorizes the relationship in some respect, e.g. as social, personal or other.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **social** relationship concerned with social roles

**personal** relationship concerned with personal roles, e.g. kinship, marriage, etc.

[Default]

**other** other kinds of relationship

@name supplies a name for the kind of relationship of which this is an instance.

*Status* Required

*Datatype* data.enumerated

*Values* an open list of application-dependent keywords

@active identifies the ‘active’ participants in a non-mutual relationship, or all the participants in a mutual one.

*Status* Optional

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

*Values* a list of identifier values for participant or participant groups

@mutual supplies a list of participants amongst all of whom the relationship holds equally.

*Status* Optional

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

*Values* a list of identifier values for participant or participant groups

@passive identifies the ‘passive’ participants in a non-mutual relationship.

*Status* Optional

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

*Values* a list of identifier values for participant or participant groups

 att.global.facs.attributes,
 att.global.change.attributes,
 att.dataable.attributes,
 att.dataable.w3c.attributes,
 att.dataable.iso.attributes,
 att.dataable.custom.attributes,
 att.editLike.attributes,
 att.dimensions.attributes,
 att.ranging.attributes,
 att.responsibility.attributes,
 att.canonical.attributes,
 att.sortable.attributes,
 attribute type { "social" | "personal" | "other" | xsd:Name }?,
 attribute name { data.enumerated },
 (
 attribute active { list { data.pointer+ } }?
 | attribute mutual { list { data.pointer+ } }?
),
 attribute passive { list { data.pointer+ } }?,
 desc?
}

```

*Schematron* <s:report test="@active and @mutual">Only one of the attributes @active and @mutual may be supplied</s:report>

*Schematron* <s:report test="@passive and not(@active)">the attribute 'passive' may be supplied only if the attribute 'active' is supplied</s:report>

*Example*

```

<relation
 type="social"
 name="supervisor"
 active="#p1"
 passive="#p2 #p3 #p4"/>

```

This indicates that the person with identifier p1 is supervisor of persons p2, p3, and p4.

*Example*

```

<relation type="personal" name="friends" mutual="#p2 #p3 #p4"/>

```

This indicates that p2, p3, and p4 are all friends.

*Example*

```
<relation
 type="CRM"
 name="P87_is_identified_by"
 active="http://id.clarosnet.org/places/ashmol/placecode/22584"
 passive="http://id.clarosnet.org/places/ashmol/placename/orvieto"/>
```

This indicates that there is a relation, defined by CIDOC CRM, between two resources identified by URLs.

*Note* Only one of the attributes *active* and *mutual* may be supplied; the attribute *passive* may be supplied only if the attribute *active* is supplied. Not all of these constraints can be enforced in all schema languages.

---

**<relationGrp>** (relation group) provides information about relationships identified amongst people, places, and organizations, either informally as prose or as formally expressed relation links. [13.3.2.3. *Personal Relationships*]

 </relationGrp>

```

The persons with identifiers p1 and p2 are the parents of p3 and p4; they are also married to each other; p1 is the employer of p3, p5, p6, and p7.

*Example*

```

<relationGrp>
 <p>All speakers are members of the Ceruli family, born in Naples.</p>
</relationGrp>

```

*Note* May contain a prose description organized as paragraphs, or a sequence of <relation> elements. This element is retained for reasons of backwards compatibility, but is deprecated and will be removed at a later release. The element <listRelation> should be used in preference.

---

**<remarks>** contains any commentary or discussion about the usage of an element, attribute, class, or entity not otherwise documented within the containing element. [22.4.4. *Element Specifications* 22.4.5. *Attribute List Specification* 22.4.6. *Element Classes* 22.4.7. *Pattern Documentation*]

<remarks>
 <p>This element is probably redundant.</p>
</remarks>

```

*Note* Contains at least one paragraph, unless it is empty. As defined in ODD, must contain paragraphs; should be special para

**<rendition>** supplies information about the rendition or appearance of one or more elements in the source text.  
[2.3.4. The Tagging Declaration]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.styleDef (@scheme,  
@schemeVersion)

@scope where CSS is used, provides a way of defining ‘pseudo-elements’, that is, styling rules applicable to specific sub-portions of an element.

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **first-line** styling applies to the first line of the target element

**first-letter** styling applies to the first letter of the target element

**before** styling should be applied immediately before the content of the target element

**after** styling should be applied immediately after the content of the target element

```

*Note* The attributes `key` or `ref`, inherited from the class `att.canonical` may be used to indicate the kind of responsibility in a normalized form, by referring directly (using `ref`) or indirectly (using `key`) to a standardized list of responsibility types, such as that maintained by a naming authority, for example the list maintained at <http://www.loc.gov/marc/relators/relacode.html> for bibliographic usage.

---

**<respons>** (responsibility) identifies the individual(s) responsible for some aspect of the content or markup of particular element(s). [21.3. *Attribution of Responsibility*]

*Module* certainty — Certainty, Precision, and Responsibility

*Attributes* `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@rend`, `@style`, `@rendition`, `@xml:base`, `@xml:space`) (`att.global.linking` (`@corresp`, `@synch`, `@sameAs`, `@copyOf`, `@next`, `@prev`, `@exclude`, `@select`)) (`att.global.analytic` (`@ana`)) (`att.global.facs` (`@facs`)) (`att.global.change` (`@change`)) `att.scoping` (`@target`, `@match`)

`@locus` indicates the specific aspect of the encoding (markup or content) for which responsibility is being assigned.

*Status* Required

*Datatype* 1–∞ occurrences of `data.enumerated` separated by whitespace

*Legal values are:* **name** responsibility is being assigned concerning the name of the element or attribute used.

**start** responsibility is being assigned concerning the start of the element concerned.

**end** responsibility is being assigned concerning the end of the element concerned.

**location** responsibility is being assigned concerning the location of the element concerned.

**value** responsibility is being assigned concerning the content (for an element) or the value (for an attribute)

`@resp` (responsible party) identifies the individual or agency responsible for the indicated aspect of the electronic text.

*Status* Required

*Datatype* `data.pointer`

*Values* a pointer to one of the identifiers typically but not necessarily declared in the current document header, associated with a person asserted as responsible for some aspect of the text's creation, transcription, editing, or encoding

*Member of* `model.certLike` `model.global.meta`

*Contained by*

 attribute locus
 {
 list { ("name" | "start" | "end" | "location" | "value")+ }
 },
 attribute resp { data.pointer },
 (model.descLike | model.certLike)*
}

```

*Example*

```

<respons target="#p1" locus="name location" resp="#encoder1"/>
<respons
 target="#p2"
 match="@rend"
 locus="value"
 resp="#encoder2"/>
<list type="encoders">
 <item xml:id="encoder1"/>
 <item xml:id="encoder2"/>
</list>

```

*Example* In this (partially fictional) example the entire document was transcribed and encoded by a single encoder, except for one passage which was transcribed and encoded by the proofreader.

```

<!-- in the <teiHeader>: --><respStmt xml:id="enc01">
 <name>C. Colin Backslash</name>
 <resp>transcription</resp>
 <resp>encoding</resp>
</respStmt>
<respStmt xml:id="prf01">
 <name>Erin Spelling</name>
 <resp>proofreading</resp>
</respStmt>
<!-- in the <text>: -->
<p>θερινή τροπή
<lb/>
 <foreign xml:lang="heb" xml:id="mp0a8"> □

 <p rend="break(no)">Amazing!</p>
 </sp>
 </spGrp>
 <stage rend="align(right)slant(italic)" type="delivery" xml:id="atoncel">All together.</stage>
 <!-- anywhere: -->
 <respons
 target="sgrp05"
 locus="name"
 resp="../contextual/persons.xml#rcapolung.ewo">
 <desc>Ashley did not know what to do with this; I have decided it
 best fits as a braced <gi>spGrp</gi>
 </desc>
 </respons>
 <respons
 target="sgrp05"
 match="../@rend"
 locus="value"
 resp="../contextual/persons.xml#sbauman.emt">
 <desc>fixed <att>rend</att> attributes</desc>
 </respons>

```

*Note* The <respons> element is designed for cases in which fine-grained information about specific aspects of the markup of a text is desirable for whatever reason. Global responsibility for certain aspects of markup is usually more simply indicated in the TEI header, using the <respStmt> element within the title statement, edition statement, or change log.

**<respStmt>** (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work. [3.11.2.2. *Titles, Authors, and Editors* 2.2.1. *The Title Statement* 2.2.2. *The Edition Statement* 2.2.5. *The Series Statement*]

```

element retrace
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.spanning.attributes,
 att.transcriptional.attributes,
 att.editLike.attributes,
 att.dimensions.attributes,
 att.ranging.attributes,
 att.responsibility.attributes,
 macro.paraContent}

```

*Note* Multiple retraces are indicated by nesting one <retrace> within another. In principle, a retrace differs from a substitution in that second and subsequent rewrites do not materially alter the content of an element. Where minor changes have been made during the retracing action however these may be marked up using <del>, <add>, etc. with an appropriate value for the change attribute.

---

**<revisionDesc>** (revision description) summarizes the revision history for a file. [2.5. *The Revision Description*  
2.1.1. *The TEI Header and its Components*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.docStatus.attributes,
 (list | listChange | change+)
}

```

*Example*

```

<revisionDesc status="embargoed">
 <change when="1991-11-11" who="#LB"> deleted chapter 10 </change>
</revisionDesc>

```

*Note* If present on this element, the status attribute should indicate the current status of the document. The same attribute may appear on any <change> to record the status at the time of that change. Conventionally change elements should be given in reverse date order, with the most recent change at the start of the list.

---

## <rhyme> marks the rhyming part of a metrical line. [6.4. Rhyme]

*Module* `verse` — Verse

*Attributes* `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@rend`, `@style`, `@rendition`, `@xml:base`, `@xml:space`)  
`(att.global.linking` (`@corresp`, `@synch`, `@sameAs`, `@copyOf`, `@next`, `@prev`, `@exclude`, `@select`))  
`(att.global.analytic` (`@ana`)) `(att.global.facs` (`@facs`)) `(att.global.change` (`@change`)) `att.typed` (`@type`,  
`@subtype`)

`@label` provides a label to identify which part of a rhyme scheme this rhyming string instantiates.

*Status* Recommended

*Datatype* `data.word`

*Values* usually contains a single letter.

*Note* Within a particular scope, all <rhyme> elements with the same value for their label attribute are assumed to rhyme with each other. The scope is defined by the nearest ancestor element for which the rhyme attribute has been supplied.

*Member of* `model.lPart`

*Contained by*

 att.global.facs.attributes,
 att.global.change.attributes,
 att.personal.attributes,
 att.naming.attributes,
 att.canonical.attributes,
 att.typed.attributes,
 macro.phraseSeq}

```

*Example*

```

<persName>
 <forename>William</forename>
 <surname>Poulteny</surname>
 <roleName>Earl of Bath</roleName>
</persName>

```

*Note* A <roleName> may be distinguished from an <addName> by virtue of the fact that, like a title, it typically exists independently of its holder.

**<root>** (root node) represents the root node of a tree. [19.2. Trees]

*Module* nets — Graphs, Networks, and Trees

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@value provides the value of the root, which is a feature structure or other analytic element.

*Status* Optional

*Datatype* data.pointer

*Values* A valid identifier of a feature structure or other analytic element.

@children provides a list of identifiers of the elements which are the children of the root node.

*Status* Required

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

*Values* A list of valid identifiers.

*Note* If the root has no children (i.e., the tree is ‘trivial’), then the children attribute must be omitted. For technical reasons, it cannot be specified as <root children="">>.

@ord (ordered) indicates whether or not the root is ordered.

*Status* Optional

*Datatype* data.xTruthValue

*Note* The value true indicates that the children of the root are ordered, whereas false indicates the are unordered. Use if and only if ord is specified as partial on the <tree> element and the root has more than one child.

@outDegree gives the out degree of the root, the number of its children.

*Status* Optional

*Datatype* data.count

*Note* The in degree of the root is always 0.

*Members of*

*nets:* tree

*May contain*

*core:* label

*Declaration*

```

element root
{
 att.global.attributes,
 att.global.linking.attributes,

 att.typed.attributes,
 macro.phraseSeq}

```

*Schematron* <s:report test="tei:s">You may not nest one s element within another: use seg instead</s:report>

*Example*

```

<head>
 <s>A short affair</s>
</head>
<s>When are you leaving?</s>
<s>Tomorrow.</s>

```

*Note* The <s> element may be used to mark orthographic sentences, or any other segmentation of a text, provided that the segmentation is end-to-end, complete, and non-nesting. For segmentation which is partial or recursive, the <seg> should be used instead. The type attribute may be used to indicate the type of segmentation intended, according to any convenient typology.

---

**<said>** (speech or thought) indicates passages thought or spoken aloud, whether explicitly indicated in the source or not, whether directly or indirectly reported, whether by real people or fictional characters. [3.3.3. *Quotation*]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.ascribed (@who)

@aloud may be used to indicate whether the quoted matter is regarded as having been vocalized or signed.

*Status* Optional

*Datatype* data.xTruthValue

*Default* unknown

```
<p> Celia thought privately, <said
 aloud="false">Dorothea quite despises Sir James Chettam;
 I believe she would not accept him.</said> Celia felt that this was a pity.
```

```
<!-- ... -->
```

```
</p>
```

*Note* The value true indicates the encoded passage was expressed outwardly (whether spoken, signed, sung, screamed, chanted, etc.); the value false indicates that the encoded passage was thought, but not outwardly expressed.

@direct may be used to indicate whether the quoted matter is regarded as direct or indirect speech.

*Status* Optional

*Datatype* data.xTruthValue

*Default* true

```
<!-- in the header --><editorialDecl>
 <quotation
 marks="none"/>
</editorialDecl>
<!-- -->
<p> Tantripp had brought a card, and said that there was a gentleman waiting in the
lobby.
The courier had told him that <said
 direct="false">only Mrs. Casaubon was at home</said>,
but he said <said
 direct="false">he was a relation of Mr. Casaubon's: would she see him?</said>
</p>
```

*Note* The value true indicates the speech or thought is represented directly; the value false that speech or thought is represented indirectly, e.g. by use of a marked verbal aspect.

 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.declarable.attributes,
}

```

```
model.pLike+
}
```

*Example*

```
<samplingDecl>
 <p>Samples of up to 2000 words taken at random from the beginning, middle, or end of each
 text identified as relevant by respondents.</p>
</samplingDecl>
```

*Note* This element records all information about systematic inclusion or omission of portions of the text, whether a reflection of sampling procedures in the pure sense or of systematic omission of material deemed either too difficult to transcribe or not of sufficient interest.

**<schemaSpec>** (schema specification) generates a TEI-conformant schema and documentation for it. [2.3. *The Encoding Description 22.2. Modules and Schemas 23.5.1. Making a Unified ODD*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.identified (@ident,  
 @predeclare, @module, @status) (att.combinable (@mode) (att.deprecated (@validUntil)) ) att.namespaceable  
 (@ns) att.readFrom (@source)

@start specifies entry points to the schema, i.e. which elements may be used as the root of documents conforming to it.

*Status* Optional

*Datatype* 1–∞ occurrences of `data.name` separated by whitespace

*Default* TEI

@prefix specifies a default prefix which will be prepended to all patterns relating to TEI elements, unless otherwise stated.

*Status* Optional

*Datatype* `" " | data.xmlName`

*Note* Use of this attribute allows an external schema which has an element with the same local name as a TEI element to be mixed in.

@targetLang (target language) specifies which language to use when creating the objects in a schema if names for elements or attributes are available in more than one language

*Status* Optional

*Datatype* `data.language`

@docLang (documentation language) specifies which languages to use when creating documentation if the description for an element, attribute, class or macro is available in more than one language

*Status* Optional

*Datatype* 1–∞ occurrences of `data.language` separated by whitespace

*Member of* model.divPart model.encodingDescPart

*Contained by*

*core:* item note q quote said stage

*drama:* castList epilogue performance prologue set view

*figures:* cell figure

 attribute docLang { list { data.language+ } }?,
 (
 (model.glossLike | model.descLike)*,
 (model.oddRef | model.oddDecl)*,
 constraintSpec*
)
}

```

*Example*

```

<schemaSpec prefix="TEI_" ident="testsvg" start="TEI svg">
 <moduleRef source="tei:current" key="header"/>
 <moduleRef key="core"/>
 <moduleRef key="drama"/>
 <moduleRef url="svg11.rng"/>
</schemaSpec>

```

This schema combines elements from the current versions of the drama and core modules, the current release version of the header module, and elements from an existing RELAXNG schema available from the URL indicated.

*Note* A <schemaSpec> combines references to modules, individual element or macro declarations, and specification groups together to form a unified schema. The processing of the <schemaSpec> element must resolve any conflicts amongst the declarations it contains or references. Different ODD processors may generate schemas and documentation using different concrete syntaxes.

---

**<scriptDesc>** contains a description of the scripts used in a manuscript or similar source. [10.7.2.1. Writing]

*Example*

```

<seg>When are you leaving?</seg>
<seg>Tomorrow.</seg>

```

*Example*

```

<s>
 <seg rend="caps" type="initial-cap">So father's only</seg> glory was the ballfield.
</s>

```

*Example*

```

<seg type="preamble">
 <seg>Sigmund, <seg type="patronym">the son of Volsung</seg>, was a king in Frankish country.</seg>
 <seg>Sinfiotli was the eldest of his sons ...</seg>
 <seg>Borghild, Sigmund's wife, had a brother ... </seg>
</seg>

```

*Note* The <seg> element may be used at the encoder's discretion to mark any segments of the text of interest for processing. One use of the element is to mark text features for which no appropriate markup is otherwise defined. Another use is to provide an identifier for some segment which is to be pointed at by some other element—i.e. to provide a target, or a part of a target, for a <ptr> or other similar element.

**<segmentation>** describes the principles according to which the text has been segmented, for example into sentences, tone-units, graphemic strata, etc. [2.3.3. *The Editorial Practices Declaration* 15.3.2. *Declarable Elements*]

*Module header* — The TEI Header

}

```

*Example*

```

<set>
 <p>The action takes place on February 7th between the hours of noon and six in the
 afternoon, close to the Trenartha Tin Plate Works, on the borders of England and Wales,
 where a strike has been in progress throughout the winter.</p>
</set>

```

*Example*

```

<set>
 <head>SCENE</head>
 <p>A Sub-Post Office on a late autumn evening</p>
</set>

```

*Example*

```

<front>
 <!-- <titlePage>, <div type="Dedication">, etc. -->
 <set>
 <list type="gloss">
 <label>TIME</label>
 <item>1907</item>
 <label>PLACE</label>
 <item>East Coast village in England</item>
 </list>
 </set>
</front>

```

*Note* Contains paragraphs or phrase level tags. This element should not be used outside the front matter; for similar contextual descriptions within the body of the text, use the <stage> element.

---

**<setting>** describes one particular setting in which a language interaction takes place. [15.2.3. The Setting Description]

*Module* corpus — Language Corpora

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

```

```
<region>Scotland</region>
</placeName>
```

**<sex>** specifies the sex of a person. [13.3.2.1. *Personal Characteristics*]

*Module* namesdates — Names, Dates, People, and Places

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.editLike (@evidence, @source, @instant) (att.dimensions (@unit, @quantity, @extent, @precision, @scope) (att.ranging (@atLeast, @atMost, @min, @max, @confidence))) (att.responsibility (@cert, @resp)) att.dateable (@calendar, @period) (att.dateable.w3c (@when, @notBefore, @notAfter, @from, @to)) (att.dateable.iso (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso)) (att.dateable.custom (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod))

@value supplies a coded value for sex

*Status* Optional

*Datatype* 1–∞ occurrences of `data.sex` separated by whitespace

*Note* Values for this attribute may be locally defined by a project, or may refer to an external standard, such as vCard's sex property

<http://microformats.org/wiki/gender-formats> (in which M indicates male, F female, O other, N none or not applicable, U unknown), or the often used ISO 5218:2004 *Representation of Human Sexes* [http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266\\_ISO\\_IEC\\_5218\\_2004\(E\\_F\).zip](http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004(E_F).zip) (in which 0 indicates unknown; 1 male; 2 female; and 9 not applicable, although the ISO standard is widely considered inadequate); cf. CETH's *Recommendations for Inclusive Data Collection of Trans People*

<http://transhealth.ucsf.edu/trans?page=lib-data-collection>.

```

*Note* As with other culturally-constructed traits such as age, the way in which this concept is described in different cultural contexts may vary. The normalizing attributes are provided only as an optional means of simplifying that variety to one or more external standards for purposes of interoperability, or project-internal taxonomies for consistency, and should not be used where that is inappropriate or unhelpful. The content of the element may be used to describe the intended concept in more detail, using plain text.

---

**<shift/>** marks the point at which some paralinguistic feature of a series of utterances by any one speaker changes.  
[8.3.6. Shifts]

*Module* spoken — Transcriptions of Speech

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.ascribed (@who)  
@feature a paralinguistic feature.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **tempo** speed of utterance.

**loud** loudness.

**pitch** pitch range.

**tension** tension or stress pattern.

**rhythm** rhythmic qualities.

**voice** voice quality.

**@new** specifies the new state of the paralinguistic feature specified.

*Status* Optional

*Datatype* data.enumerated

*Default* normal

*Values* An open list (for an example of possible values, see 8.4.2. *Synchronization and Overlap*)

*Note* If no value is specified, it is assumed that the feature concerned ceases to be remarkable.  
The value ‘normal’ has the same effect.

*Note* The content of this element may be used as an alternative to the more formal specification made possible by its attributes; it may also be used to supplement the formal specification with commentary or clarification.

**<sound>** describes a sound effect or musical sequence specified within a screen play or radio script. [7.3.1. *Technical Information 7.3. Other Types of Performance Text*]

*Module* drama — Performance Texts

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type categorizes the sound in some respect, e.g. as music, special effect, etc.

*Status* Optional

*Datatype* data.enumerated

@discrete indicates whether the sound overlaps the surrounding speeches or interrupts them.

*Status* Optional

*Datatype* data.xTruthValue

*Default* unknown

*Note* The value true indicates that the sound is heard between the surrounding speeches; the value false indicates that the sound overlaps one or more of the surrounding speeches.

---

<space> indicates the location of a significant space in the copy text. [11.5.1. Space]

### Module *transcr* — Representation of Primary Sources

*Attributes* *att.global* (*@xml:id*, *@n*, *@xml:lang*, *@rend*, *@style*, *@rendition*, *@xml:base*, *@xml:space*)  
*(att.global.linking* (*@corresp*, *@synch*, *@sameAs*, *@copyOf*, *@next*, *@prev*, *@exclude*, *@select*))  
*(att.global.analytic* (*@ana*)) *(att.global.facs* (*@facs*)) *(att.global.change* (*@change*)) *att.dimensions* (*@unit*,  
*@quantity*, *@extent*, *@precision*, *@scope*) *(att.ranging* (*@atLeast*, *@atMost*, *@min*, *@max*, *@confidence*))

*@dim* (dimension) indicates whether the space is horizontal or vertical.

*Status* Recommended

*Datatype* `data.enumerated`

*Legal values are:* **horizontal** the space is horizontal.

**vertical** the space is vertical.

*Note* For irregular shapes in two dimensions, the value for this attribute should reflect the more important of the two dimensions. In conventional left-right scripts, a space with both vertical and horizontal components should be classed as vertical.

*@resp* (responsible party) indicates the individual responsible for identifying and measuring the space.

*Status* Optional

*Datatype* `data.pointer`

*Values* a pointer to one of the identifiers typically but not necessarily declared in the current document header, associated with a person asserted as responsible for some aspect of the text's creation, transcription, editing, or encoding

*Member of* *model.global.edit*

}

```

Example

By god if wommen had writen storyes  
 As <space quantity="7" unit="minims"/> han within her oratoryes

Example

στρατηλάτ<space quantity="1" unit="chars"/>ου

**Note** This element should be used wherever it is desired to record an unusual space in the source text, e.g. space left for a word to be filled in later, for later rubrication, etc. It is not intended to be used to mark normal inter-word space or the like.

**<span>** associates an interpretative annotation directly with a span of text. [17.3. Spans and Interpretations]

Module analysis — Simple Analytic Mechanisms

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

 @inst) (att.responsibility (@cert, @resp)) att.pointing (@targetLang, @target, @evaluate)

@from gives the identifier of the node which is the starting point of the span of text being annotated; if not accompanied by a to attribute, gives the identifier of the node of the entire span of text being annotated.

Status Optional

Datatype data.pointer

Values The identifier of the element which occurs at the beginning of the passage.

@to gives the identifier of the node which is the end-point of the span of text being annotated.

Status Optional

Datatype data.pointer

Values The identifier of the element which occurs at the end of the passage.

 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@key (identifier) supplies the identifier of the documentary element or class for which a description is to be obtained.

*Status* Optional

*Datatype* data.name

```
<specDesc
 key="emph" />
```

@atts (attributes) supplies attribute names for which descriptions should additionally be obtained.

*Status* Recommended

*Datatype* 0–∞ occurrences of data.name separated by whitespace

*Values* a whitespace-separated list of attribute names

```
<specDesc
 key="foreign"
 atts="usage xml:lang" />
```

*Note* The attribute names listed may include both attributes inherited from a class and those defined explicitly for the associated element. If the atts attribute is not supplied, then descriptions for all non-inherited attributes are listed, along with references to any classes. If an empty string is supplied as the value for the atts attribute, then no description should be displayed.

element specGrp
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (model.oddDecl | model.oddRef | model.divPart) *
}

```

## Example

```

<specGrp xml:id="xDAILC">
 <elementSpec ident="s">
<!-- ... -->
 </elementSpec>
 <elementSpec ident="cl">
<!-- ... -->
 </elementSpec>
 <elementSpec ident="w">
<!-- ... -->
 </elementSpec>
 <elementSpec ident="m">
<!-- ... -->
 </elementSpec>
 <elementSpec ident="c">
<!-- ... -->
 </elementSpec>
</specGrp>

```

This specification group with identifier xDAILC contains specifications for the elements <s>,<cl>,<w>, etc.

*Note* A specification group is referenced by means of its xml:id attribute. The declarations it contains may be included in a <schemaSpec> or <moduleSpec> element only by reference (using a <specGrpRef> element): it may not be nested within a <moduleSpec> element. Different ODD processors may generate representations

of the specifications contained by a <specGrp> in different concrete syntaxes. For P5 the intention is to generate modules using both XML and RELAX NG, and to use only the compressed RELAX NG syntax to represent them.

**<specGrpRef/>** (reference to a specification group) indicates that the declarations contained by the <specGrp> referenced should be inserted at this point. [22.2. Modules and Schemas]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@target points at the specification group which logically belongs here.

*Status* Required

*Datatype* data.pointer

*Member of* model.oddDecl

*Contained by*

*core:* add corr del desc emph head hi item l meeting note orig p q quote ref reg said sic stage title unclear

*dictionaries:* case colloc def dictScrap entryFree etym form gen gram gramGrp hyph iType lang lbl mood number

*May contain* Empty element

*Declaration*

```

element specGrpRef
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute target { data.pointer },
 empty
}

```

*Example*

```

<p>This part of the module contains declarations for names of persons, places, and
organisations: <specGrpRef target="#names.pers"/>
 <specGrpRef target="#names.place"/>
 <specGrpRef target="#names.org"/>
</p>
<!-- elsewhere -->
<specGrp xml:id="names.pers">
<!--... -->
</specGrp>
<!-- elsewhere -->
<specGrp xml:id="names.place">
<!--... -->
</specGrp>
<!-- elsewhere -->
<specGrp xml:id="names.org">
<!--... -->
</specGrp>

```

*Note* In ODD documentation processing, a <specGrpRef> usually produces a comment indicating that a set of declarations printed in another section will be inserted at this point in the <specGrp> being discussed. In schema processing, the contents of the specified <specGrp> are made available for inclusion in the generated schema. The specification group identified by the target attribute will normally be part of the current ODD document.

---

**<specList>** (specification list) marks where a list of descriptions is to be inserted into the prose documentation.

*Note* Sponsors give their intellectual authority to a project; they are to be distinguished from *funders*, who provide the funding but do not necessarily take intellectual responsibility.

---

**<stage>** (stage direction) contains any kind of stage direction within a dramatic text or fragment. [3.12.2. *Core Tags for Drama* 3.12. *Passages of Verse or Drama* 7.2.4. *Stage Directions*]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.ascribed (@who) att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type indicates the kind of stage direction.

*Status* Recommended

*Datatype* data.enumerated

*Suggested values include:* **setting** describes a setting.

**entrance** describes an entrance.

**exit** describes an exit.

**business** describes stage business.

**novelistic** is a narrative, motivating stage direction.

**delivery** describes how a character speaks.

**modifier** gives some detail about a character.

**location** describes a location.

**mixed** more than one of the above

 </desc>
 </state>
</org>

```

*Note* Where there is confusion between <trait> and <state> the more general purpose element <state> should be used even for unchanging characteristics. If you wish to distinguish between characteristics that are generally perceived to be time-bound states and those assumed to be fixed traits, then <trait> is available for the more static of these. The <state> element encodes characteristics which are sometimes assumed to change, often at specific times or over a date range, whereas the <trait> elements are used to record characteristics, such as eye-colour, which are less subject to change. Traits are typically, but not necessarily, independent of the volition or action of the holder.

---

}
```

*Example*

```
<supportDesc>
 <support> Parchment roll with <material>silk</material> ribbons.
</support>
</supportDesc>
```

**<surface>** defines a written surface as a two-dimensional coordinate space, optionally grouping one or more graphic representations of that space, zones of interest within that space, and transcriptions of the writing within them. [11.1. Digital Facsimiles 11.2.2. Embedded Transcription]

*Module* transcr — Representation of Primary Sources

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.coordinated (@start,  
 @ulx, @uly, @lrx, @lry) att.declaring (@decls) att.typed (@type, @subtype)  
 @attachment describes the method by which this surface is or was connected to the main surface

*Status* Optional

*Datatype* `data.enumerated`

*Sample values include:* **glued** glued in place

**pinned** pinned or stapled in place

**sewn** sewn in place

@flipping indicates whether the surface is attached and folded in such a way as to provide two writing surfaces

*Status* Optional

*Datatype* `data.truthValue`

*Members defined by*

*transcr:* facsimile sourceDoc surface surfaceGrp zone

*May contain*

*analysis:* interp interpGrp span spanGrp

*certainty:* certainty precision respons

*core:* binaryObject cb desc gap gb graphic index label lb media milestone note pb

*figures:* figure formula notatedMusic

*Declaration*

```

element surface
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.coordinated.attributes,
 att.declaring.attributes,
 att.typed.attributes,
 attribute attachment { data.enumerated }?,
 attribute flipping { data.truthValue }?,
 (
 (model.global | model.labelLike | model.graphicLike)*,
 ((zone | line | surface | surfaceGrp), model.global*)*
)
}

```

*Example*

```

<facsimile>
 <surface
 ulx="0"
 uly="0"
 lrx="200"
 lry="300">
 <graphic url="Bovelles-49r.png"/>
 </surface>
</facsimile>

```

*Note* The <surface> element represents any two-dimensional space on some physical surface forming part of the source material, such as a piece of paper, a face of a monument, a billboard, a scroll, a leaf etc. The coordinate space defined by this element may be thought of as a grid lrx - ulx units wide and uly - lry units high. The <surface> element may contain graphic representations or transcriptions of written zones, or both. The coordinate values used by every <zone> element contained by this element are to be understood with reference to the same grid. Where it is useful or meaningful to do so, any grouping of multiple <surface> elements may be indicated using the <surfaceGrp> elements.

**<surfaceGrp>** defines any kind of useful grouping of written surfaces, for example the recto and verso of a single leaf, which the encoder wishes to treat as a single unit. [11.1. Digital Facsimiles]

*Module* transcr — Representation of Primary Sources

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

 <syll>ar|e|a</syll>
</form>
```

**<symbol/>** (symbolic value) represents the value part of a feature-value specification which contains one of a finite list of symbols. [18.3. *Other Atomic Feature Values*]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.datcat (@datcat,  
 @valueDatcat)

@value supplies the symbolic value for the feature, one of a finite list that may be specified in a feature declaration.

*Status* Required

*Datatype* data.word

*Values* A string, e.g. *feminine*.

*Member of* model.featureVal.single

*Contained by*

*iso-fs:* f fvLib if vAlt vColl vDefault vLabel vMerge vNot vRange

*May contain* Empty element

*Declaration*

```
element symbol
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.datcat.attributes,
 attribute value { data.word },
 empty
}
```

*Example*

```
<f name="gender">
 <symbol value="feminine"/>
</f>
```

**<table>** contains text displayed in tabular form, in rows and columns. [14.1.1. *TEI Tables*]

*Module* figures — Tables, Formulæ, Graphics and Notated Music

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
@rows indicates the number of rows in the table.

*Status* Optional

*Datatype* `data.count`

*Values* If no number is supplied, an application must calculate the number of rows.

*Note* Rows should be presented from top to bottom.

@cols (columns) indicates the number of columns in each row of the table.

*Status* Optional

*Datatype* `data.count`

*Values* If no number is supplied, an application must calculate the number of columns.

*Note* Within each row, columns should be presented left to right.

*Member of* model.listLike

*Contained by*

*core:* add corr del desc emph head hi item l meeting note orig p q quote ref reg said sic sp stage title unclear

)
 }

```

### Example

```

<table rows="4" cols="4">
 <head>Poor Men's Lodgings in Norfolk (Mayhew, 1843)</head>
 <row role="label">
 <cell role="data"/>
 <cell role="data">Dossing Cribs or Lodging Houses</cell>
 <cell role="data">Beds</cell>
 <cell role="data">Needys or Nightly Lodgers</cell>
 </row>
 <row role="data">
 <cell role="label">Bury St Edmund's</cell>
 <cell role="data">5</cell>
 <cell role="data">8</cell>
 <cell role="data">128</cell>
 </row>
 <row role="data">
 <cell role="label">Thetford</cell>
 <cell role="data">3</cell>
 <cell role="data">6</cell>
 <cell role="data">36</cell>
 </row>
 <row role="data">
 <cell role="label">Attleboro'</cell>
 <cell role="data">3</cell>
 <cell role="data">5</cell>
 <cell role="data">20</cell>
 </row>
 <row role="data">
 <cell role="label">Wymondham</cell>
 <cell role="data">1</cell>
 <cell role="data">11</cell>
 <cell role="data">22</cell>
 </row>
</table>

```

*Note* Contains an optional heading and a series of rows. Any rendition information should be supplied using the global rend attribute, at the table, row, or cell level as appropriate.

**<tag>** contains text of a complete start- or end-tag, possibly including attribute specifications, but excluding the opening and closing markup delimiter characters. [22. *Documentation Elements*]

*Module* tagdocs — Documentation Elements

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type indicates the type of XML tag intended

Status Optional

Datatype data.enumerated

Legal values are: **start** a start-tag, with delimiters < and > is intended

**end** an end-tag, with delimiters </ and > is intended

**empty** a empty tag, with delimiters < and /> is intended

**pi** a pi (processing instruction), with delimiters <? and ?> is intended

**comment** a comment, with delimiters <!-- and --> is intended

**ms** a marked-section, with delimiters <[CDATA[ and ]]> is intended

@scheme supplies the name of the schema in which this tag is defined.

Status Optional

Datatype data.enumerated

Sample values include: **TEI** (text encoding initiative) This tag is defined as part of the TEI scheme.[Default]

**DBK** (docbook) this tag is part of the Docbook scheme.

**XX** (unknown) this tag is part of an unknown scheme.

**Schematron**

**HTML**

 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@gi (element name) specifies the name (generic identifier) of the element indicated by the tag.

*Status* Required

*Datatype* data.name

*Values* the name of an element within the namespace indicated by the parent <namespace> element

@occurs specifies the number of occurrences of this element within the text.

*Status* Recommended

*Datatype* data.count

@withId (with unique identifier) specifies the number of occurrences of this element within the text which bear a distinct value for the global xml:id attribute.

*Status* Recommended

*Datatype* data.count

@render specifies the identifier of a <rendition> element which defines how this element was rendered in the source text.

*Status* Optional

*Datatype* 1–∞ occurrences of data.pointer separated by whitespace

*Values* an identifier specified as the value of the xml:id attribute on some <rendition> element typically but not necessarily in the current document.

*Members defined by*

**<tech>** (technical stage direction) describes a special-purpose stage direction that is not meant for the actors. [7.3.1. *Technical Information*]

Module drama — Performance Texts

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
 @type categorizes the technical stage direction.

Status Optional

*Datatype* `data.enumerated`

*Legal values are:* **light** a lighting cue

**sound** a sound cue

**prop** a prop cue

**block** a blocking instruction

@perf (performance) identifies the performance or performances to which this technical direction applies.

*Status* Optional

*Datatype* `data.enumerated`

*Values* The IDREFS are derived from the xml:id attribute on a <performance> element.

*Member of* model.stageLike

**<TEI>** (TEI document) contains a single TEI-conformant document, comprising a TEI header and a text, either in isolation or as part of a <teiCorpus> element. [4. *Default Text Structure* 15.1. *Varieties of Composite Text*]

*Module* textstructure — Default Text Structure

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
 @version specifies the major version number of the TEI Guidelines against which this document is valid.

*Status* Optional

*Datatype* data.version

*Note* The major version number is historically prefixed by a P (for Proposal), and is distinct from the version number used for individual releases of the Guidelines, as used by (for example) the source of the <schemaSpec> element. The current version is P5.

*Members defined by*

*core:* teiCorpus

*May contain*

 att.declaring.attributes,
 att.pointing.attributes,
 att.typed.attributes,
 att.canonical.attributes,
 att.sortable.attributes,
 att.cReferencing.attributes,
 macro.phraseSeq}

```

Example

A computational device that infers structure from grammatical strings of words is known as a **<term>parser</term>**, and much of the history of NLP over the last 20 years has been occupied with the design of parsers.

Example

We may define **<term xml:id="TDPV" rend="sc">discoursal point of view</term>** as **<gloss target="#TDPV">the relationship, expressed through discourse structure, between the implied author or some other addresser, and the fiction.</gloss>**

*Note* This element is used to supply the form under which an index entry is to be made for the location of a parent **<index>** element. In formal terminological work, there is frequently discussion over whether terms must be atomic or may include multi-word lexical items, symbolic designations, or phraseological units. The **<term>** element may be used to mark any of these. No position is taken on the philosophical issue of what a term can be; the looser definition simply allows the **<term>** element to be used by practitioners of any persuasion. As with other members of the **att.canonical** class, instances of this element occurring in a text may be associated with a canonical definition, either by means of a URI (using the **ref** attribute), or by means of some system-specific code value (using the **key** attribute). Because the mutually exclusive **target** and **cRef** attributes overlap with the function of the **ref** attribute, they are deprecated and may be removed at a subsequent release.

**<terrain>** contains information about the physical terrain of a place. [13.3.4.3. States, Traits, and Events]

 att.typed.attributes,
 (
 model.global*,
 (front, model.global*)?,
 (body | group),
 model.global*,
 (back, model.global*)?
)
}
```

*Example*

```
<text>
 <front>
 <docTitle>
 <titlePart>Autumn Haze</titlePart>
 </docTitle>
 </front>
 <body>
 <l>Is it a dragonfly or a maple leaf</l>
 <l>That settles softly down upon the water?</l>
 </body>
</text>
```

*Example* The body of a text may be replaced by a group of nested texts, as in the following schematic:

```
<text>
 <front>
 <!-- front matter for the whole group -->
 </front>
 <group>
 <text>
 <!-- first text -->
 </text>
 <text>
 <!-- second text -->
 </text>
 </group>
</text>
```

*Note* This element should not be used to represent a text which is inserted at an arbitrary point within the structure of another, for example as in an embedded or quoted narrative; the <floatingText> is provided for this purpose.

**<textClass>** (text classification) groups information which describes the nature or topic of a text in terms of a standard classification scheme, thesaurus, etc. [2.4.3. *The Text Classification*]

*Module* header — The TEI Header

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

 (model.textDescPart\textunderscore sequence, purpose+)
}

```

Example

```

<textDesc n="Informal domestic conversation">
 <channel mode="s"/>
 <constitution type="single"/>
 <derivation type="original"/>
 <domain type="domestic"/>
 <factuality type="mixed"/>
 <interaction type="complete" active="plural" passive="many"/>
 <preparedness type="spontaneous"/>
 <purpose type="entertain" degree="high"/>
 <purpose type="inform" degree="medium"/>
</textDesc>

```

**<textLang>** (text language) describes the languages and writing systems identified within the bibliographic work being described, rather than its description. [3.11.2.4. *Imprint, Size of a Document, and Reprint Information* 10.6.6. *Languages and Writing Systems*]

Module core — Elements Available in All TEI Documents

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@mainLang (main language) supplies a code which identifies the chief language used in the bibliographic work.

Status Optional

Datatype data.language

Values a recognized language ‘tag’ generated according to BCP 47 which may additionally be documented by a <language> element in the header

@otherLangs (other languages) one or more codes identifying any other languages used in the bibliographic work.

Status Optional

Datatype 0–∞ occurrences of data.language separated by whitespace

Values a list of codes, each of which is a recognized language ‘tag’ generated according to BCP 47 which may additionally be documented by a <language> element in the header

}
```

*Example*

As he sat smiling, the  
quarter struck – <time when="11:45:00">the quarter to twelve</time>.

**<timeline>** (timeline) provides a set of ordered points in time which can be linked to elements of a spoken text to create a temporal alignment of that text. [16.5.2. *Placing Synchronous Events in Time*]

*Module* linking – Linking, Segmentation, and Alignment

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@origin designates the origin of the timeline, i.e. the time at which it begins.

*Status* Optional

*Datatype* data.pointer

*Values* if supplied, must point either to one of the <when> elements in its content, or to another <timeline> element.

*Note* If this attribute is not supplied, the implication is that the time of origin is not known.

@unit specifies the unit of time corresponding to the interval value of the timeline or of its constituent points in time.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* d (days)

h (hours)

min (minutes)

s (seconds)

**ms** (milliseconds)

**@interval** specifies the numeric portion of a time interval

*Status* Optional

*Datatype* `data.interval`

*Values* a positive number, or one of the two special values *irregular* or *regular*.

*Note* The value *irregular* indicates uncertainty about all the intervals in the timeline; the value *regular* indicates that all the intervals are evenly spaced, but the size of the intervals is not known; numeric values indicate evenly spaced values of the size specified. If individual points in time in the timeline are given different values for the interval attribute, those values locally override the value given in the timeline.

**<title>** contains a title for any kind of work. [3.11.2.2. *Titles, Authors, and Editors* 2.2.1. *The Title Statement* 2.2.5. *The Series Statement*]

*Module* core — Elements Available in All TEI Documents

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.canonical (@key, @ref)  
 att.typed (type, @subtype)

@type classifies the title according to some convenient typology.

*Derived from* att.typed

*Status* Optional

*Datatype* data.enumerated

*Sample values include:* **main** main title

**sub** (subordinate) subtitle, title of part

**alt** (alternate) alternate title, often in another language, by which the work is also known

**short** abbreviated form of title

**desc** (descriptive) descriptive paraphrase of the work functioning as a title

*Note* This attribute is provided for convenience in analysing titles and processing them

according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single <title> element.

@level indicates the bibliographic level for a title, that is, whether it identifies an article, book, journal, series, or unpublished material.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **a** (analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item.

**m** (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works

**j** (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper

**s** (series) the title applies to a series of otherwise distinct publications such as a collection

**u** (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press)

*Note* The level of a title is sometimes implied by its context: for example, a title appearing directly within an <analytic> element is *ipso facto* of level ‘a’, and one appearing within a <series> element of level ‘s’. For this reason, the level attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.

edition</title>

```

### Example

```

<title type="full">
 <title type="main">Synthèse</title>
 <title type="sub">an international journal for
 epistemology, methodology and history of
 science</title>
</title>

```

*Note* The attributes key and ref, inherited from the class att.canonical may be used to indicate the canonical form

for the title; the former, by supplying (for example) the identifier of a record in some external library system; the latter by pointing to an XML element somewhere containing the canonical form of the title.

**<titlePage>** (title page) contains the title page of a text, appearing within the front or back matter. [4.6. Title Pages]

*Module* textstructure — Default Text Structure

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
 @type classifies the title page according to any convenient typology.

*Status* Optional

*Datatype* data.enumerated

*Note* This attribute allows the same element to be used for volume title pages, series title pages, etc., as well as for the 'main' title page of a work.

*Member of* model.frontPart

*Contained by*

<docImprint>Printed at <name type="place">London</name> for <name>T.P.</name>
 <date>1612.</date>
</docImprint>
</titlePage>

```

**<titlePart>** contains a subsection or division of the title of a work, as indicated on a title page. [4.6. *Title Pages*]

*Module* textstructure — Default Text Structure

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@type specifies the role of this subdivision of the title.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* **main** main title of the work [Default]

**sub** (subordinate) subtitle of the work

**alt** (alternate) alternative title of the work

**short** abbreviated form of title

 (
 trait+
 | (model.headLike*, model.pLike+, (model.noteLike | model.biblLike)*)
 | ((model.labelLike | model.noteLike | model.biblLike)*)
)
}

```

*Example*

```

<trait type="physical">
 <label>Eye colour</label>
 <desc>Blue</desc>
</trait>

```

*Note* Where there is confusion between <trait> and <state> the more general purpose element <state> should be used even for unchanging characteristics. If you wish to distinguish between characteristics that are generally perceived to be time-bound states and those assumed to be fixed traits, then <trait> is available for the more static of these. The <state> element encodes characteristics which are sometimes assumed to change, often at specific times or over a date range, whereas the <trait> elements are used to record characteristics, such as eye-colour, which are less subject to change. Traits are typically, but not necessarily, independent of the volition or action of the holder.

**<transpose>** describes a single textual transposition as an ordered list of at least two pointers specifying the order in which the elements indicated should be re-combined. [11.3.4.5. *Transpositions*]

*Module* transcr — Representation of Primary Sources

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of*

*Contained by*

*transcr:* listTranspose

*May contain*

*core:* ptr

*Declaration*

```

element transpose
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (ptr, ptr+)
}

```

#### Example

```

<transpose>
 <ptr target="#ib02"/>
 <ptr target="#ib01"/>
</transpose>

```

The transposition recorded here indicates that the content of the element with identifier `ib02` should appear before the content of the element with identifier `ib01`.

*Note* Transposition is usually indicated in a document by a metamark such as a wavy line or numbering. The order in which `<ptr>` elements appear within a `<transpose>` element should correspond with the desired order, as indicated by the metamark.

---

**<tree>** encodes a tree, which is made up of a root, internal nodes, leaves, and arcs from root to leaves. [19.2. *Trees*]

*Module* nets — Graphs, Networks, and Trees

*Attributes* `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@rend`, `@style`, `@rendition`, `@xml:base`, `@xml:space`)  
 (`att.global.linking` (`@corresp`, `@synch`, `@sameAs`, `@copyOf`, `@next`, `@prev`, `@exclude`, `@select`))  
 (`att.global.analytic` (`@ana`)) (`att.global.facs` (`@facs`)) (`att.global.change` (`@change`))

`@arity` gives the maximum number of children of the root and internal nodes of the tree.

*Status* Optional

*Datatype* `data.count`

`@ord` (ordered) indicates whether or not the tree is ordered, or if it is partially ordered.

*Status* Required

*Datatype* `data.enumerated`

*Legal values are:* **true** indicates that all of the branching nodes of the tree are ordered.

[Default]

**partial** indicates that some of the branching nodes of the tree are ordered and some are unordered.

**false** indicates that all of the branching nodes of the tree are unordered.

`@order` gives the order of the tree, i.e., the number of its nodes.

*Status* Optional

*Datatype* `data.count`

*Note* The size of a tree is always one less than its order, hence there is no need for both a size and order attribute.

*Member of* `model.divPart`

</leaf>
</tree>

```

*Note* A root, and zero or more internal nodes and leaves, but if there is an internal node, there must also be at least one leaf.

**<triangle>** (underspecified embedding tree, so called because of its characteristic shape when drawn) provides for an underspecified eTree, that is, an eTree with information left out. [19.3. *Another Tree Notation*]

*Module* nets — Graphs, Networks, and Trees

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@value provides the value of a triangle, which is the identifier of a feature structure or other analytic element.

*Status* Optional

*Datatype* data.pointer

*Values* A valid identifier of a feature structure or other analytic element.

*Member of* defined by

*nets:* eTree forest triangle

*May contain*

*core:* label

*nets:* eLeaf eTree triangle

*Declaration*

```

element triangle
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute value { data.pointer }?,
 (label?, (eTree | triangle | eLeaf)*)
}

```

*Example*

```

<triangle>
 <label>NP</label>
 <eLeaf>
 <label>the periscope</label>
 </eLeaf>
</triangle>

```

*Note* An optional label followed by zero or more embedding trees, triangles, or embedding leaves.

**<typeDesc>** contains a description of the typefaces or other aspects of the printing of an incunable or other printed source. [10.7.2.1. *Writing*]

*Module* msdescription — Manuscript Description

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

<u trans="latching" who="#spkr2">well Joe and I set it between us</u>
<list type="speakers">
 <item xml:id="spkr1"/>
 <item xml:id="spkr2"/>
</list>

```

*Note* Prose and a mixture of speech elements Although individual transcriptions may consistently use <u> elements for turns or other units, and although in most cases a <u> will be delimited by pause or change of

speaker, <u> is not required to represent a turn or any communicative event, nor to be bounded by pauses or change of speaker. At a minimum, a <u> is some phonetic production by a given speaker.

**<unclear>** contains a word, phrase, or passage which cannot be transcribed with certainty because it is illegible or inaudible in the source. [11.3.3.1. *Damage, Illegibility, and Supplied Text* 3.4.3. *Additions, Deletions, and Omissions*]

Module core — Elements Available in All TEI Documents

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
(att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.editLike (@evidence,  
@source, @instant) (att.dimensions (@unit, @quantity, @extent, @precision, @scope) (att.ranging (@atLeast,  
@atMost, @min, @max, @confidence))) (att.responsibility (@cert, @resp))

@reason indicates why the material is hard to transcribe.

Status Optional

Datatype 1–∞ occurrences of `data.word` separated by whitespace

Values one or more words describing the difficulty, e.g. *faded*, *background-noise*,  
*passing-truck*, *illegible*, *eccentric-ductus*.

```
<div>
 <head>Rx</head>
 <p>500 mg <unclear
 reason="illegible">placebo</unclear>
 </p>
</div>
```

@hand Where the difficulty in transcription arises from action (partial deletion, etc.) assignable to an identifiable hand, signifies the hand responsible for the action.

Status Optional

Datatype `data.pointer`

Values must point to a hand identifier typically but not necessarily declared in the document header (see section 11.3.2.1. *Document Hands*).

@agent Where the difficulty in transcription arises from damage, categorizes the cause of the damage, if it can be identified.

Status Optional

Datatype `data.enumerated`

Sample values include: **rubbing** damage results from rubbing of the leaf edges

**mildew** damage results from mildew on the leaf surface

**smoke** damage results from smoke

*May contain* Empty element

*Declaration*

```

element undo
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.spanning.attributes,
 att.transcriptional.attributes,
 att.editLike.attributes,
 att.dimensions.attributes,
 att.ranging.attributes,
 att.responsibility.attributes,
 attribute target { list { data.pointer+ } }?,
 empty
}

```

*Example*

```

<line>This is <del change="#s2" rend="overstrike">
 <seg xml:id="undo-a">just some</seg>
 sample <seg xml:id="undo-b">text</seg>,
 we need
 <add change="#s2">not</add>
a real example.</line>
<undo target="#undo-a #undo-b" rend="dotted" change="#s3"/>

```

This encoding represents the following sequence of events:

- "This is just some sample text, we need a real example" is written
- At stage s2, "just some sample text, we need" is deleted by overstriking, and "not" is added
- At stage s3, parts of the deletion are cancelled by underdotting, thus reinstating the words "just some" and "text".

---

**<unicodeName>** (unicode property name) contains the name of a registered Unicode normative or informative property. [5.2.1. *Character Properties*]

*Module* gaiji — Non-standard Characters and Glyphs

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@version specifies the version number of the Unicode Standard in which this property name is defined.

*Status* Optional

*Datatype* data.version

*Values* a valid Unicode version number.

Member of *defined by*

*gaiji*: charProp

May contain Character data only

Declaration

```

element unicodeName
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute version { data.version }?,
 text
}

```

Example

```

<unicodeName>character-decomposition-mapping</unicodeName>
<unicodeName>general-category</unicodeName>

```

*Note* A definitive list of current Unicode property names is provided in The Unicode Standard.

<usg> (usage) contains usage information in a dictionary entry. [9.3.5.2. Usage Information and Other Labels]

Module dictionaries — Dictionaries

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

```

---

**<variantEncoding/>** declares the method used to encode text-critical variants. [12.1.1. *The Apparatus Entry*]

*Module* textcrit — Critical Apparatus

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
 @method indicates which method is used to encode the apparatus of variants.

*Status* Required

*Datatype* data.enumerated

*Legal values are:* **location-referenced** apparatus uses line numbers or other canonical reference scheme referenced in a base text.

**double-end-point** apparatus indicates the precise locations of the beginning and ending of each lemma relative to a base text.

**parallel-segmentation** alternate readings of a passage are given in parallel in the text; no notion of a base text is necessary.

*Note* The value 'parallel-segmentation' requires in-line encoding of the apparatus.

@location indicates whether the apparatus appears within the running text or external to it.

*Status* Required

*Datatype* data.enumerated

*Schematron* <sch:rule context="tei:variantEncoding"> <sch:assert test="(@location != 'external') or (@method != 'parallel-segmentation')"> The @location value "external" is inconsistent with the parallel-segmentation method of apparatus markup.</sch:assert></sch:rule>

*Legal values are:* **internal** apparatus appears within the running text.

**external** apparatus appears outside the base text.

*Note* The value 'external' is inconsistent with the parallel-segmentation method of apparatus markup.

*Member of* model.encodingDescPart

*Contained by*

 "" The @location value "external" is inconsistent with the parallel-segmentation method of apparatus markup
],
 empty
}

```

*Example*

```
<variantEncoding method="location-referenced" location="external"/>
```

**<vColl>** (collection of values) represents the value part of a feature-value specification which contains multiple values organized as a set, bag, or list. [18.7. Collections as Complex Feature Values]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))  
 @org (organization) indicates organization of given value or values as set, bag or list.

*Status* Optional

*Datatype* `data.enumerated`

*Legal values are:* **set** indicates that the given values are organized as a set.

**bag** indicates that the given values are organized as a bag (multiset).

**list** indicates that the given values are organized as a list.

*Member of* model.featureVal.complex

*Contained by*

*iso-fs:* f fvLib if vAlt vDefault vLabel vMerge vNot vRange

*May contain*

*iso-fs:* binary default fs numeric string symbol vAlt vLabel

*Declaration*

```
element vColl
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute org { "set" | "bag" | "list" }?,
 ((fs | model.featureVal.single)*)
}
```

*Example*

```
<f name="name">
 <vColl>
 <string>Jean</string>
 <string>Luc</string>
 <string>Godard</string>
 </vColl>
</f>
```

*Example*

```
<fs>
 <f name="lex">
 <symbol value="auxquels"/>
 </f>
 <f name="maf">
 <vColl org="list">
```

```

 <fs>
 <f name="cat">
 <symbol value="prep"/>
 </f>
 </fs>
 <fs>
 <f name="cat">
 <symbol value="pronoun"/>
 </f>
 <f name="kind">
 <symbol value="rel"/>
 </f>
 <f name="num">
 <symbol value="pl"/>
 </f>
 <f name="gender">
 <symbol value="masc"/>
 </f>
 </fs>
 </vColl>
</f>
</fs>

```

**<vDefault>** (value default) declares the default value to be supplied when a feature structure does not contain an instance of <f> for this name; if unconditional, it is specified as one (or, depending on the value of the org attribute of the enclosing <fDecl>) more <fs> elements or primitive values; if conditional, it is specified as one or more <if> elements; if no default is specified, or no condition matches, the value none is assumed. [18.11. Feature System Declaration]

Module iso-fs — Feature Structures

Attributes att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)

## Declaration

```

element view
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 macro.specialPara}

```

## Example

```

<view>
 <name>Max</name> joins his daughter
 at the window. <hi>Rain</hi> sprays his
 face--
</view>
<view>
 <camera>Max's POV</camera> He sees occasional
 windows open, and just across from his apartment
 house, a <hi>man</hi> opens the front door of
 a brownstone--
</view>

```

## Example

```

<div type="shot">
 <view>BBC World symbol</view>
 <sp>
 <speaker>Voice Over</speaker>
 <p>Monty Python's Flying Circus tonight comes to you live
 from the Grillomat Snack Bar, Paignton.</p>
 </sp>
</div>
<div type="shot">

```

```

<view>Interior of a nasty snack bar. Customers around, preferably
 real people. Linkman sitting at one of the plastic tables.</view>
<sp>
 <speaker>Linkman</speaker>
 <p>Hello to you live from the Grillomat Snack Bar.
 </p>
</sp>
</div>

```

*Note* A view is a particular form of stage direction.

**<vLabel>** (value label) represents the value part of a feature-value specification which appears at more than one point in a feature structure. [18.6. *Re-entrant Feature Structures*]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@name supplies a name for the sharing point.

*Status* Required

*Datatype* data.word

*Values* An identifying name.

*Member of* model.featureVal.single

*Contained by*

*iso-fs:* f fvLib if vAlt vColl vDefault vLabel vMerge vNot vRange

*May contain*

*iso-fs:* binary default fs numeric string symbol vAlt vColl vLabel vMerge vNot

*Declaration*

```

element vLabel
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute name { data.word },
 model.featureVal?
}

```

*Example*

```

<fs>
 <f name="nominal">
 <fs>
 <f name="nm-num">
 <vLabel name="L1">
 <symbol value="singular"/>
 </vLabel>
 </f>
 </fs>
 <!-- other nominal features -->
</f>
</fs>

```

```

<f name="verbal">
 <fs>
 <f name="vb-num">
 <vLabel name="L1"/>
 </f>
 </fs>
<!-- other verbal features -->
</f>
</fs>

```

**<vMerge>** (merged collection of values) represents a feature value which is the result of merging together the feature values contained by its children, using the organization specified by the *org* attribute. [18.8.3. *Collection of Values*]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@org indicates the organization of the resulting merged values as set, bag or list.

*Status* Optional

*Datatype* data.enumerated

*Legal values are:* **set** indicates that the resulting values are organized as a set.

**bag** indicates that the resulting values are organized as a bag (multiset).

**list** indicates that the resulting values are organized as a list.

*Member of* model.featureVal.complex

*Contained by*

*iso-fs:* f fvLib if vAlt vDefault vLabel vMerge vNot vRange

*May contain*

*iso-fs:* binary default fs numeric string symbol vAlt vColl vLabel vMerge vNot

*Declaration*

```

element vMerge
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute org { "set" | "bag" | "list" }?,
 model.featureVal+
}

```

*Example*

```

<vMerge org="list">
 <vColl org="set">
 <symbol value="masculine"/>
 <symbol value="neuter"/>
 <symbol value="feminine"/>
 </vColl>

```

```
<symbol value="indeterminate"/>
</vMerge>
```

This example returns a list, concatenating the indeterminate value with the set of values masculine, neuter and feminine.

**<vNot>** (value negation) represents a feature value which is the negation of its content. [18.8.2. Negation]

*Module* iso-fs — Feature Structures

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

*Member of* model.featureVal.complex

*Contained by*

*iso-fs:* f fvLib if vAlt vDefault vLabel vMerge vNot vRange

*May contain*

*iso-fs:* binary default fs numeric string symbol vAlt vColl vLabel vMerge vNot

*Declaration*

```
element vNot
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 (model.featureVal)
}
```

*Example*

```
<vNot>
 <symbol value="masculine"/>
</vNot>
```

*Example*

```
<f name="mode">
 <vNot>
 <vAlt>
 <symbol value="infinitive"/>
 <symbol value="participle"/>
 </vAlt>
 </vNot>
</f>
```

**<vocal>** marks any vocalized but not necessarily lexical phenomenon, for example voiced pauses, non-lexical backchannels, etc. [8.3.3. Vocal, Kinesic, Incident]

*Module* spoken — Transcriptions of Speech

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

(att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.timed (@start, @end)  
 (att.duration (att.duration.w3c (@dur)) (att.duration.iso (@dur-iso)) ) att.ascribed (@who) att.typed (@type,  
 @subtype)

@iterated indicates whether or not the phenomenon is repeated.

*Status* Optional

*Datatype* `data.xTruthValue`

*Default* false

*Note* The value true indicates that the vocal effect is repeated several times rather than just occurring once.

*Member of* model.global.spoken

**<when/>** indicates a point in time either relative to other elements in the same timeline tag, or absolutely. [16.5.2. *Placing Synchronous Events in Time*]

*Module* linking — Linking, Segmentation, and Alignment

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change))

@absolute supplies an absolute value for the time.

*Status* Optional

*Datatype* data.temporal.w3c

*Note* This attribute should always be specified on a <when> element which serves as the target for the origin attribute of a <timeLine>.

@unit specifies the unit of time in which the interval value is expressed, if this is not inherited from the parent <timeline>.

*Status* Optional

*Datatype* data.enumerated

*Suggested values include:* d (days)

h (hours)

min (minutes)

s (seconds)

ms (milliseconds)

@interval specifies the numeric portion of a time interval

*Status* Optional

*Datatype* data.interval

*Values* a positive number, or the special value unknown.

*Note* The value unknown indicates uncertainty about the interval.

@since identifies the reference point for determining the time of the current <when> element, which is obtained by adding the interval to the time of the reference point.

*Status* Optional

*Datatype* data.pointer

*Values* Should point to another <when> element in the same <timeline>.

*Note* If this attribute is omitted, and the absolute attribute is not specified, then the reference point is understood to be the origin of the enclosing <timeline> tag.

*Member of* *confined by*

*linking:* timeline

*May contain* Empty element

*Declaration*

```

element when
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 attribute absolute { data.temporal.w3c }?,
 attribute unit { "d" | "h" | "min" | "s" | "ms" | xsd:Name }?,
 attribute interval { data.interval }?,
 attribute since { data.pointer }?,
 empty
}

```

*Example*

```
<when xml:id="TW3" interval="20" since="#w2"/>
```

*Note* On this element, the global `xml:id` attribute must be supplied to specify an identifier for this point in time. The value used may be chosen freely provided that it is unique within the document and is a syntactically valid name. There is no requirement for values containing numbers to be in sequence.

---

**<width>** contains a measurement measured along the axis parallel to the bottom of the written surface, i.e. perpendicular to the spine of a book or codex. [10.3.4. *Dimensions*]

*Module* msdescription — Manuscript Description

 target="#W026x"
 resp="#PR"
 wit="#El"
 type="presentation">Ornamental capital.</witDetail>

```

*Note* The <witDetail> element should be regarded as a specialized type of <note> element; it is synonymous with <note type='witnessDetail'>, but differs in the omission of some attributes seldom applicable to notes within critical apparatus, and in the provision of the wit attribute, which permits an application to extract all annotation concerning a particular witness or witnesses from the apparatus. It also differs in that the location of a <witDetail> element is not significant and may not be used to imply the point of attachment for the annotation; this must be explicitly given by means of the target attribute.

---

**<witEnd/>** (fragmented witness end) indicates the end, or suspension, of the text of a fragmentary witness. [12.1.5. *Fragmentary Witnesses*]

 att.timed.attributes,
 att.duration.w3c.attributes,
 att.duration.iso.attributes,
 att.source.attributes,
 attribute gradual { data.xTruthValue }?,
 macro.paraContent}

```

*Example*

```

<!-- ... --><l>man in a coonskin cap</l>
<writing>coonskin</writing>
<l>in a pig pen</l>
<writing>pig pen</writing>
<l>wants eleven dollar bills</l>
<writing>20 dollar bills</writing>
<l>you only got ten</l>
<writing>10</writing>
<!-- ... -->

```

*Note* The <writing> element will usually be short and most simply transcribed as a character string; the content model also allows a sequence of paragraphs and paragraph-level elements, in case the writing has enough internal structure to warrant such markup. In either case the usual phrase-level tags for written text are available.

**<Xr>** (cross-reference phrase) contains a phrase, sentence, or icon referring the reader to some other location in this or another text. [9.3.5.3. *Cross-References to Other Entries*]

*Module* dictionaries — Dictionaries

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.lexicographic  
 (@expand, @norm, @split, @value, @orig, @location, @mergedIn, @opt) (att.datcat (@datcat, @valueDatcat))

@type indicates the type of cross reference, using any convenient typology.

*Status* Recommended

*Datatype* data.enumerated

*Sample values include:* **syn** (synonym) cross reference for synonym information

**etym** (etymological) etymological information

**cf** (compare or consult) related or similar term

**illus** (illustration) illustration of an object

</entry>

```

*Example*

```

<entry>
 <form>
 <orth>lawful</orth>
 </form>
 <xr type="syn">SYN. see <ref>legal</ref>
 </xr>
</entry>

```

*Note* May contain character data and phrase-level elements; usually contains a <ref> or a <ptr> element. This element encloses both the actual indication of the location referred to, which may be tagged using the <ref> or <ptr> elements, and any accompanying material which gives more information about why the reader is being referred there.

**<zone>** defines any two-dimensional area within a <surface> element. [11.1. Digital Facsimiles 11.2.2. Embedded Transcription]

*Module* transcr — Representation of Primary Sources

*Attributes* att.global (@xml:id, @n, @xml:lang, @rend, @style, @rendition, @xml:base, @xml:space)  
 (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))  
 (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) att.coordinated (@start,  
 @ulx, @uly, @lrx, @lry) att.typed (@type, @subtype)

@points identifies a two dimensional area within the bounding box specified by the other attributes by means of a series of pairs of numbers, each of which gives the x,y coordinates of a point on a line enclosing the area.

*Status* Optional

*Datatype* 3–∞ occurrences of `data.point` separated by whitespace

@rotate indicates the amount by which this zone has been rotated clockwise, with respect to the normal orientation of the parent <surface> element as implied by the dimensions given in the <msDesc> element or by the coordinates of the <surface> itself. The orientation is expressed in arc degrees.

*Status* Optional

*Datatype* `data.count`

*Default* 0

*Member of* model.linePart

*Contained by*

*transcr:* line surface zone

*May contain*

*Declaration*

```

element zone
{
 att.global.attributes,
 att.global.linking.attributes,
 att.global.analytic.attributes,
 att.global.facs.attributes,
 att.global.change.attributes,
 att.coordinated.attributes,
 att.typed.attributes,
 attribute points
 {
 list { data.point, data.point, data.point, data.point* }
 }?,
 attribute rotate { data.count }?,
 (text | model.graphicLike | model.global | surface | model.linePart)*
}

```

### Example

```
<surface
 ulx="14.54"
 uly="16.14"
 lrx="0"
 lry="0">
 <graphic url="stone.jpg" />
 <zone
 points="4.6,6.3 5.25,5.85 6.2,6.6 8.19222,7.4125 9.89222,6.5875 10.9422,6.1375 11.4422,6.7125
8.21722,8.3125 6.2,7.65"/>
</surface>
```

This example defines a non-rectangular zone: see the illustration in section 11.4. *Advanced uses of Surface and Zone*.

### Example

```
<facsimile>
 <surface
 ulx="50"
 uly="20"
 lrx="400"
 lry="280">
 <zone
 ulx="0"
 uly="0"
 lrx="500"
 lry="321">
 <graphic url="graphic.png" />
 </zone>
 </surface>
</facsimile>
```

This example defines a zone which has been defined as larger than its parent surface in order to match the dimensions of the graphic it contains.

*Note* The position of every zone for a given surface is always defined by reference to the coordinate system defined for that surface. A graphic element contained by a zone represents the whole of the zone. A zone may be of any shape. The attribute `points` may be used to define a polygonal zone, using the coordinate system defined by its parent surface.

## E Datatypes and Other Macros

---

**data.certainty** defines the range of attribute values expressing a degree of certainty.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- certainty/@cert
- precision/@precision
- purpose/@degree

*Declaration* `data.certainty = "high" | "medium" | "low" | "unknown"`

*Note* Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter. For more precise indication, data.probability may be used instead or in addition.

---

**data.count** defines the range of attribute values used for a non-negative integer value used as a count.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- age/@value
- datatype/@minOccurs
- graph/@order
- graph/@size
- handDesc/@hands
- iNode/@outDegree
- layout/@columns
- layout/@ruledLines
- layout/@writtenLines
- node/@inDegree
- node/@outDegree
- node/@degree
- refState/@length
- root/@outDegree
- sense/@level
- table/@rows
- table/@cols
- tagUsage/@occurs
- tagUsage/@withId
- tree/@arity
- tree/@order
- zone/@rotate

*Declaration* `data.count = xsd:nonNegativeInteger`

*Note* Only positive integer values (including zero) are permitted

**data.duration.iso** defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats

*Module* tei — The TEI Infrastructure

*Used by*

*Declaration*

```
data.duration.iso = token { pattern = "[0-9.,DHMPRSTWYZ/;+\\-]+" }
```

*Example*

```
<time dur-iso="PT0,75H">three-quarters of an hour</time>
```

*Example*

```
<date dur-iso="P1,5D">a day and a half</date>
```

*Example*

```
<date dur-iso="P14D">a fortnight</date>
```

*Example*

```
<time dur-iso="PT0.025">20 ms</time>
```

*Note* A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first 'time' number-letter pair. For complete details, see ISO 8601 *Data elements and interchange formats — Information interchange — Representation of dates and times*.

**data.duration.w3c** defines the range of attribute values available for representation of a duration in time using W3C datatypes.

*Module* tei — The TEI Infrastructure

*Used by*

*Declaration* `data.duration.w3c = xsd:duration`

*Example*

```
<time dur="PT45M">forty-five minutes</time>
```

*Example*

```
<date dur="P1DT12H">a day and a half</date>
```

*Example*

```
<date dur="P7D">a week</date>
```

*Example*

```
<time dur="PT0.02S">20 ms</time>
```

*Note* A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first ‘time’ number-letter pair. For complete details, see the W3C specification.

---

**data.enumerated** defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- usg/@type
- vColl/@org
- vMerge/@org
- valList/@type
- variantEncoding/@method
- variantEncoding/@location

- when/@unit
- witDetail/@type
- xr/@type

**Declaration** `data.enumerated = data.name`

**Note** Attributes using this datatype must contain a word which follows the rules defining a legal XML name (see <http://www.w3.org/TR/REC-xml/#dt-name>): for example they cannot include whitespace or begin with digits. Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a <valList> element.

---

**data.interval** defines attribute values used to express an interval value.

**Module** tei — The TEI Infrastructure

**Used by** Element:

- timeline/@interval
- when/@interval

**Declaration**

```
data.interval =
 xsd:float { minExclusive = "0" } | "regular" | "irregular" | "unknown"
```

**Note** Any value greater than zero or any one of the values regular, irregular, unknown.

---

**data.language** defines the range of attribute values used to identify a particular combination of human language and writing system. [*vi.1 Language identification*]

**Module** tei — The TEI Infrastructure

**Used by** Element:

- langKnowledge/@tags
- langKnown/@tag
- language/@ident
- schemaSpec/@targetLang
- schemaSpec/@docLang
- textLang/@mainLang
- textLang/@otherLangs

**Declaration** `data.language = xsd:language | ""`

**Note** The values for this attribute are language ‘tags’ as defined in BCP 47. Currently BCP 47 comprises RFC 4646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice. A ‘language tag’, per BCP 47, is assembled from a sequence of components or *subtags* separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.

**language** The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at <http://www.iana.org/assignments/language-subtag-registry>. It is recommended that this code be written in lower case.

**script** The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is

maintained by the Unicode Consortium, and is available at <http://unicode.org/iso15924/iso15924-codes.html>. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.

**region** Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case. The list of codes can be found at <http://www.iso.org/iso/en/prods-services/iso3166ma/02iso-3166-code-lists/index.html>. The latter consist of 3 digits; the list of codes can be found at <http://unstats.un.org/unsd/methods/m49/m49.htm>.

**variant** An IANA-registered variation. These codes ‘are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags’.

**extension** An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.

**private use** An extension that uses the initial subtag of the single letter x (i.e., starts with x-) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI conformant, a corresponding <language> element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the IANA registry that do not match the above syntax, but are present because they have been ‘grandfathered’ from previous specifications. Second, an entire language tag can consist of only a private use subtag. These tags start with x-, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding <language> element in the TEI header.

Examples include

**sn** Shona

**zh-TW** Taiwanese

**zh-Hant-HK** Chinese written in traditional script as used in Hong Kong

**en-SL** English as spoken in Sierra Leone

**pl** Polish

**es-MX** Spanish as spoken in Mexico

**es-419** Spanish as spoken in Latin America

The W3C Internationalization Activity has published a useful introduction to BCP 47, Language tags in HTML and XML.

---

**data.name** defines the range of attribute values expressed as an XML Name.

*Module* tei — The TEI Infrastructure

*Used by* att data.enumerated giElement:

- application/@ident
- equiv/@name
- f/@name
- fDecl/@name

- fsDecl/@baseTypes
- index/@indexName
- join/@result
- joinGrp/@result
- memberOf/@key
- prefixDef/@ident
- schemaSpec/@start
- specDesc/@key
- specDesc/@atts
- tagUsage/@gi

*Declaration* `data.name = xsd:Name`

*Note* Attributes using this datatype must contain a single word which follows the rules defining a legal XML name (see <http://www.w3.org/TR/REC-xml/#dt-name>): for example they cannot include whitespace or begin with digits.

---

**data.namespace** defines the range of attribute values used to indicate XML namespaces as defined by the W3C Namespaces in XML Technical Recommendation.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- attDef/@ns
- namespace/@name

*Declaration* `data.namespace = xsd:anyURI`

*Note* The range of syntactically valid values is defined by RFC 3986 *Uniform Resource Identifier (URI): Generic Syntax*

---

**data.numeric** defines the range of attribute values used for numeric values.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- memberOf/@max
- memberOf/@min
- num/@value
- numeric/@value
- numeric/@max
- precision/@stdDeviation

*Declaration*

```
data.numeric =
 xsd:double | token { pattern = "(\\-?[\\d]+/\\-?[\\d]+)" } | xsd:decimal
```

*Note* Any numeric value, represented as a decimal number, in floating point format, or as a ratio. To represent a floating point number, expressed in scientific notation, 'E notation', a variant of 'exponential notation', may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The

value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3. A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.

---

**data.outputMeasurement** defines a range of values for use in specifying the size of an object that is intended for display.

*Module* tei — The TEI Infrastructure

*Used by*

*Declaration*

```
data.outputMeasurement =
 token
 {
 pattern = "[\\-+]?\\d+(\\.\\d+)?(\\%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)"
 }
```

*Example*

```
<figure>
 <head>The TEI Logo</head>
 <figDesc>Stylized yellow angle brackets with the letters <mentioned>TEI</mentioned> in
 between and <mentioned>text encoding initiative</mentioned> underneath, all on a white
 background.</figDesc>
 <graphic
 height="600px"
 width="600px"
 url="http://www.tei-c.org/logos/TEI-600.jpg"/>
</figure>
```

*Note* These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft.

---

**data.pattern** (regular expression pattern) defines attribute values which are expressed as a regular expression.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- metDecl/@pattern

*Declaration* data.pattern = token

*Note* A regular expression, often called a *pattern*, is an expression that describes a set of strings. They are usually used to give a concise description of a set, without having to list all elements. For example, the set containing the three strings *Handel*, *Händel*, and *Haendel* can be described by the pattern H(ä|ae?)ndel (or alternatively, it is said that the pattern H(ä|ae?)ndel *matches* each of the three strings)

---

**data.percentage** defines attribute values used to express a percentage value.

*Module* tei — The TEI Infrastructure

*Used by*

*Declaration*

```
data.percentage = xsd:nonNegativeInteger { maxInclusive = "100" }
```

*Note* Any non-negative integer value less than 100.

---

**data.point** defines the data type used to express a point in cartesian space.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- zone/@points

*Declaration*

```
data.point = token { pattern = "(\\-?[0-9]+\\.?[0-9]*,\\-?[0-9]+\\.?[0-9]*)" }
```

*Example*

```
<facsimile>
 <surface
 ulx="0"
 uly="0"
 lrx="400"
 lry="280">
 <zone points="220,100 300,210 170,250 123,234">
 <graphic url="handwriting.png "/>
 </zone>
 </surface>
</facsimile>
```

*Note* A point is defined by two numeric values, which may be expressed in any notation permitted.

---

**data.pointer** defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- alt/@target
- alt/@targets
- app/@from
- app/@to
- arc/@from
- arc/@to
- catRef/@scheme
- certainty/@given
- change/@target
- classCode/@scheme
- eLeaf/@value
- eTree/@value
- equiv/@uri

- equiv/@filter
- event/@where
- f/@fVal
- fs/@feats
- fsdLink/@target
- g/@ref
- gap/@hand
- handShift/@new
- iNode/@value
- iNode/@children
- iNode/@parent
- iNode/@follow
- join/@targets
- keywords/@scheme
- leaf/@value
- leaf/@parent
- leaf/@follow
- link/@targets
- locus/@scheme
- locusGrp/@scheme
- metamark/@target
- moduleRef/@url
- move/@perf
- msContents/@class
- msItem/@class
- msItemStruct/@class
- node/@value
- node/@adjTo
- node/@adjFrom
- node/@adj
- normalization/@source
- note/@targetEnd
- nym/@parts
- occupation/@scheme
- occupation/@code
- redo/@target
- relatedItem/@target
- relation/@active
- relation/@mutual
- relation/@passive

- respons/@resp
- root/@value
- root/@children
- socecStatus/@scheme
- socecStatus/@code
- space/@resp
- span/@from
- span/@to
- specGrpRef/@target
- tagUsage/@render
- timeline/@origin
- triangle/@value
- unclear/@hand
- undo/@target
- w/@lemmaRef
- when/@since
- witDetail/@wit

**Declaration** `data.pointer = xsd:anyURI`

**Note** The range of syntactically valid values is defined by RFC 3986 *Uniform Resource Identifier (URI): Generic Syntax*. Note that the values themselves are encoded using RFC 3987 *Internationalized Resource Identifiers* (IRIs) mapping to URLs. For example, `https://secure.wikimedia.org/wikipedia/en/wiki/%` is encoded as `https://secure.wikimedia.org/wikipedia/en/wiki/%25` while `http://وزارة-الاتصالات.مصر` is encoded as `http://xn--4gbrim.xn----rmckbbajlc6dj7bxne2c.xn--wgbh1c/`

---

**data.probability** defines the range of attribute values expressing a probability.

**Module** `tei` — The TEI Infrastructure

**Used by** Element:

- alt/@weights
- certainty/@degree
- precision/@degree

**Declaration**

`data.probability = xsd:double { minInclusive = "0" maxInclusive = "1" }`

**Note** Probability is expressed as a real number between 0 and 1; 0 representing *certainly false* and 1 representing *certainly true*.

---

**data.replacement** defines attribute values which contain a replacement template.

**Module** `tei` — The TEI Infrastructure

**Used by**

**Declaration** `data.replacement = text`

---

**data.sex** defines the range of attribute values used to identify human or animal sex.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- person/@sex
- personGrp/@sex
- sex/@value

*Declaration* `data.sex = data.word`

*Note* Values for attributes using this datatype may be locally defined by a project, or may refer to an external standard, such as vCard's sex property <http://microformats.org/wiki/gender-formats> (in which M indicates male, F female, O other, N none or not applicable, U unknown), or the often used ISO 5218:2004 *Representation of Human Sexes* [http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266\\_ISO\\_IEC\\_5218\\_2004\(E\\_F\).zip](http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004(E_F).zip) (in which 0 indicates unknown; 1 male; 2 female; and 9 not applicable, although the ISO standard is widely considered inadequate); cf. CETH's *Recommendations for Inclusive Data Collection of Trans People* <http://transhealth.ucsf.edu/trans?page=lib-data-collection>.

---

**data.temporal.iso** defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the international standard *Data elements and interchange formats – Information interchange – Representation of dates and times*.

*Module* tei — The TEI Infrastructure

*Used by*

*Declaration*

```
data.temporal.iso =
 xsd:date
 | xsd:gYear
 | xsd:gMonth
 | xsd:gDay
 | xsd:gYearMonth
 | xsd:gMonthDay
 | xsd:time
 | xsd:dateTime
 | token { pattern = "[0-9.,DHMPRSTWYZ/:\-]+" }
```

*Note* If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used. For all representations for which ISO 8601 describes both a *basic* and an *extended* format, these Guidelines recommend use of the extended format. While ISO 8601 permits the use of both 00:00 and 24:00 to represent midnight, these Guidelines strongly recommend against the use of 24:00.

---

**data.temporal.w3c** defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C *XML Schema Part 2: Datatypes* specification.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- docDate/@when
- when/@absolute

*Declaration*

```
data.temporal.w3c =
 xsd:date
 | xsd:gYear
 | xsd:gMonth
 | xsd:gDay
 | xsd:gYearMonth
 | xsd:gMonthDay
 | xsd:time
 | xsd:dateTime
```

*Note* If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

---

**data.text** defines the range of attribute values used to express some kind of identifying string as a single sequence of unicode characters possibly including whitespace.

*Module* `tei` — The TEI Infrastructure

*Used by* Element:

- `distinct/@time`
- `distinct/@space`
- `distinct/@social`
- `refState/@delim`
- `valItem/@ident`
- `w/@lemma`

*Declaration* `data.text = string`

*Note* Attributes using this datatype must contain a single ‘token’ in which whitespace and other punctuation characters are permitted.

---

**data.truthValue** defines the range of attribute values used to express a truth value.

*Module* `tei` — The TEI Infrastructure

*Used by* Element:

- `binary/@value`
- `content/@autoPrefix`
- `fDecl/@optional`
- `listChange/@ordered`
- `metSym/@terminal`
- `note/@anchored`
- `numeric/@trunc`
- `pc/@pre`
- `surface/@flipping`

*Declaration* `data.truthValue = xsd:boolean`

*Note* The possible values of this datatype are 1 or true, or 0 or false.

*Note* This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a

value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: data.xTruthValue.

---

**data.version** defines the range of attribute values which may be used to specify a TEI version number.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- TEI/@version
- teiCorpus/@version
- unicodeName/@version

*Declaration* `data.version = token { pattern = "[\d]+(\.[\d]+){0,2}" }`

*Note* The value of this attribute follows the pattern specified by the Unicode consortium for its version number (<http://unicode.org/version>). A version number contains digits and fullstop characters only. The first number supplied identifies the major version number. A second and third number, for minor and sub-minor version numbers, may also be supplied.

---

**data.versionNumber** defines the range of attribute values used for version numbers.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- application/@version

*Declaration*

```
data.versionNumber =
 token { pattern = "[\d]+[a-z]*[\d]*(\.[\d]+[a-z]*[\d]*){0,3}" }
```

---

**data.word** defines the range of attribute values expressed as a single word or token.

*Module* tei — The TEI Infrastructure

*Used by* data.sexElement:

- app/@loc
- attRef/@name
- biblScope/@from
- biblScope/@to
- binaryObject/@encoding
- citedRange/@from
- citedRange/@to
- code/@lang
- gap/@reason
- langKnown/@level
- locus/@from
- locus/@to
- m/@baseForm
- media/@mimeType

- metSym/@value
- metamark/@function
- org/@role
- personGrp/@size
- rhyme/@label
- supplied/@reason
- surplus/@reason
- symbol/@value
- unclear/@reason
- vLabel/@name

*Declaration*

`data.word = token { pattern = "(\p{L}|\p{N}|\p{P}|\p{S})+" }`

*Note* Attributes using this datatype must contain a single ‘word’ which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

---

**data.xmlName** defines attribute values which contain an XML name.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- classRef/@key
- elementRef/@key
- macroRef/@key
- moduleRef/@prefix
- moduleRef/@include
- moduleRef/@except
- moduleRef/@key

*Declaration* `data.xmlName = xsd:NCName`

*Note* The rules defining an XML name form a part of the XML Specification.

---

**data.xpath** defines attribute values which contain an XPath expression.

*Module* tei — The TEI Infrastructure

*Used by*

*Declaration* `data.xpath = text`

*Note* Any XPath expression using the syntax defined in Kay (ed.) (2007)

---

**data.xTruthValue** (extended truth value) defines the range of attribute values used to express a truth value which may be unknown.

*Module* tei — The TEI Infrastructure

*Used by* Element:

- binding/@contemporary

- iNode/@ord
- kinesic/@iterated
- root/@ord
- said/@aloud
- said/@direct
- seal/@contemporary
- sound/@discrete
- vocal/@iterated
- writing/@gradual

### Declaration

```
data.xTruthValue = xsd:boolean | "unknown" | "inapplicable"
```

*Note* In cases where where uncertainty is inappropriate, use the datatype `data.TruthValue`.

---

**macro.anyXML** defines a content model within which any XML elements are permitted

*Module* tagdocs — Documentation Elements

*Used by* constraint egXML macro.anyXML macro.schemaPattern

### Declaration

```
macro.anyXML =
 element * - (tei:* | teix:egXML)
 {
 attribute * { text }*,
 (text | macro.anyXML)* }
```

**macro.limitedContent** (paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [1.3. The TEI Class System]

*Module* tei — The TEI Infrastructure

*Used by* desc fDescr figDesc fsDescr meeting rendition tagUsage witness

### Declaration

```
macro.limitedContent = (text | model.limitedPhrase | model.inter)*
```

**macro.paraContent** (paragraph content) defines the content of paragraphs and similar elements. [1.3. The TEI Class System]

*Module* tei — The TEI Infrastructure

*Used by* ab add camera caption case colloc corr damage def del docEdition emph gen gram hi hyph iType imprimatur l lang lbl mod mood number orig orth p per pos pron ref reg restore retrace rhyme seg sic signed sound stress subc supplied surplus syll tech title titlePart tns unclear usg writing

### Declaration

```
macro.paraContent =
 (text | model.gLike | model.phrase | model.inter | model.global | lg)*
```

**macro.phraseSeq** (phrase sequence) defines a sequence of character data and phrase-level elements. [1.4.1. *Standard Content Models*]

*Module* tei — The TEI Infrastructure

*Used by* abbr actor addName addrLine affiliation author biblScope birth bloc catchwords citedRange cl colophon country dateline death distinct distributor district docAuthor docDate edition editor education eg email expan explicit extent faith finalRubric floruit foreign forename fw genName geoDecl geogFeat geogName gloss headItem headLabel heraldry incipit label material measure mentioned name nameLink nationality num objectType occupation orgName origPlace persName phr placeName pubPlace publisher region residence role roleDesc roleName rs rubric s salute secFol settlement sex signatures soCalled socecStatus speaker stamp street summary surname term textLang trailer watermark wit witDetail

*Declaration*

```
macro.phraseSeq = (text | model.gLike | model.phrase | model.global)*
```

---

**macro.phraseSeq.limited** (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [1.4.1. *Standard Content Models*]

*Module* tei — The TEI Infrastructure

*Used by* activity age authority channel classCode constitution derivation domain factuality funder interaction langKnown language locale metSym preparedness principal purpose resp span sponsor valDesc

*Declaration*

```
macro.phraseSeq.limited = (text | model.limitedPhrase | model.global)*
```

---

**macro.schemaPattern** provides a pattern to match elements from the chosen schema language

*Module* tagdocs — Documentation Elements

*Used by* content datatype

*Declaration*

```
macro.schemaPattern = macro.anyXML
```

---

**macro.specialPara** ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [1.3. *The TEI Class System*]

*Module* tei — The TEI Infrastructure

*Used by* accMat acquisition additions cell change collation condition custEvent decoNote filiation foliation handNote item layout licence metamark musicNotation note origin provenance q quote said scriptNote source stage support surrogates typeNote view

*Declaration*

```
macro.specialPara =
(
 text
 | model.gLike | model.phrase | model.inter | model.divPart | model.global)*
```

**macro.xtext** (extended text) defines a sequence of character data and gaiji elements.

*Module* tei — The TEI Infrastructure

*Used by* c collection depth dim ex height institution locus mapping memberOf msName offset repository string  
value width

*Declaration* `macro.xtext = ( text | model.gLike )*`

### F.3 Reading list

The following lists of readings in markup theory and the TEI derive from work originally prepared by Susan Schreibman and Kevin Hawkins for the TEI Education Special Interest Group, recoded in TEI P5 by Sabine Krott and Eva Radermacher. They should be regarded only as a snapshot of work in progress, to which further contributions and corrections are welcomed (see further [http://www.tei-c.org/Activities/SIG/Education/tei\\_bibliography.xml](http://www.tei-c.org/Activities/SIG/Education/tei_bibliography.xml)).

#### Theory of Markup and XML

- [Morrison et al. ((no date))] Alan Morrison, Michael Popham, Karen Wikander. *Creating and Documenting Electronic Texts: A Guide to Good Practice*, <http://ota.ahds.ac.uk/documents/creating/> (no date).
- [Weel ((no date))] Adriaan Weel. 'The Concept of Markup'. [http://www.let.leidenuniv.nl/wgbw/~adriaan/Gut/Ch03\\_Concept\\_of\\_markup.fn.pdf](http://www.let.leidenuniv.nl/wgbw/~adriaan/Gut/Ch03_Concept_of_markup.fn.pdf) *Digital Text and the Gutenberg Heritage*, (no date). chapter 3. [in preparation; draft only]

## G Prefatory Notes

This Appendix contains (in reverse chronological order) the ‘Introductory Notes’ prefixed to each revision of the TEI Guidelines since its first publication in 1994.

### G.1 Prefatory Note (March 2002)

The primary goal of this revision has been to make available a new and corrected version of the TEI Guidelines which:

- is expressed in XML and conforms to a TEI-conformant XML DTD;
- generates a set of DTD fragments that can be combined together to form either SGML or XML document type definitions;
- corrects blatant errors, typographical mishaps, and other egregious editorial oversights;
- can be processed and maintained using readily available XML tools instead of the special-purpose ad hoc software originally used for TEI P3.

A second major design goal of this revision has been to ensure that the DTD fragments generated would not break existing documents: in other words, that any document conforming to the original TEI P3 SGML DTD would also conform to the new XML version of it. Although full backwards compatibility cannot be guaranteed, we believe our implementation is consistent with that goal.

In most respects, the TEI Guidelines have stood the test of time remarkably well. The present edition makes no substantial attempt to rewrite those few parts of them which have now been rendered obsolete by changes since their first publication, though an indication is given in the text of where such rewriting is now considered necessary. Neither does the present version attempt to address any of the many possible new areas of digital activity in which the TEI approach to standardization may have something to offer. Both these tasks require the existence of an informed and active TEI Council to direct and validate such extension and maintenance work, in response to the changing needs and priorities of the TEI user community.

Two exceptions to the above principles may be cited: firstly, the chapter which originally provided a ‘Gentle Introduction’ to SGML has been completely rewritten to provide a similarly gentle introduction to XML; secondly the chapter on character sets has been completely revised in light of the close connexion between Unicode and XML. The editors gratefully acknowledge the assistance of the *ad hoc* workgroup chaired by Christian Wittern, which undertook to provide expert advice and correction at very short notice, in the latter task.

The preparation of this new version relied extensively on preliminary work carried out by the former North American editor of the TEI Guidelines, C.M. Sperberg-McQueen. In a TEI working paper written in 1999<sup>130</sup> he sketched out a precise blueprint for the conversion of the TEI from SGML to XML, which we have implemented, with only slight modification.

The Editors would also like to express thanks to the team of volunteers from the TEI community who helped us with the task of proofreading the first draft during the summer of 2001; and to Sebastian Rahtz of Oxford University Computing Services, without whose skill and enthusiasm this new edition would not have been possible.

A substantial proportion of the work of preparing this new edition was funded with the assistance of a grant from the US National Endowment for the Humanities, whose continued support of the TEI has also been crucial to the effort of setting up the TEI Consortium.

Finally, we would like to thank all our colleagues on the interim management board of the TEI Consortium, in particular its Chairman John Unsworth, for their continued support of the TEI's work, and their willingness to devote effort to the difficult task of overseeing its transition to a new organizational infrastructure.

Summary details of the changes made in the present and previous editions are given in their Prefatory Notes, all of which are now reproduced in an Appendix to the present edition: see *Appendix G Prefatory Notes*.

Lou Burnard and Syd Bauman (TEI Editors)  
Oxford and Providence, March 2002.

### G.2 Introductory Note (November 2001)

To complete the work started in June of this year, the TEI Editors asked for volunteers from the TEI community to proofread the preliminary XML version. 24 volunteers responded to this call during August, and gave invaluable help both by identifying a number of previously un-noticed errors, and by suggesting areas in which more substantial

---

<sup>130</sup> TEI ED W69, available from the TEI web site at <http://www.tei-c.org/Vault/ED/edw69.htm>.

revision should be undertaken in the future. The Editors gratefully acknowledge the assistance of the following individuals during this exercise:

Jimmy Adair, Syd Bauman, Michael Beddow, Steven Bird, Lisa Charlong, Matthew Driscoll, Patrick Durusau, Tomaz Erjavec, Nick Finke, Tim Finney, Julia Flanders, Mike Fraser, Pankaj Kamthan, François Lachance, Terry Langendoen, Anne Mahoney, Gregory Murphy, Daniel Pitti, Rafal Prinke, Laurent Romary, Stewart Russell, Gary Simons, Elisabeth Solopova, Christian Wittern, Martin Wynne.

In addition to error correction, and clear delineation of those sections in which substantial revision is yet to be undertaken for TEI P5, the present draft differs from earlier ones in the following respects:

- Formal Public Identifiers have been introduced as a means of constructing TEI DTDs and an SGML Open Catalog is now included with the standard release;
- Some systematic errors and omissions in the reference section have been removed; the format of this section has been substantially changed, we hope for the better;
- The chapters on obtaining the TEI DTDs and WSDs have been brought up to date; the chapter on modification has been expanded to include a discussion of the TEI Lite customization;
- All examples and cited markup has been checked for XML validity against the published DTDs, and corrected where faulty; examples have been formatted in a (more or less) consistent style.

Lou Burnard and Syd Bauman (Editors)  
Oxford and Providence, November 2001.

### G.3 Introductory Note (June 2001)

This is a preliminary version of a revised and fully XML-compliant edition of the TEI Guidelines. Although work on revising and correcting the text of the document is incomplete, by making available this preliminary version we hope to facilitate testing of the XML document type declarations which it describes by as wide a range of TEI users as possible.

The primary goal of this revision is to make available the corrected (May 1999) edition of the Guidelines in a new version which:

- is expressed in XML and itself conforms to a TEI-conformant XML DTD;
- generates a set of XML DTD fragments that can be combined together in the same way as the existing TEI (P3) SGML DTD fragments to form true TEI XML DTD fragments without loss of functionality;
- can be processed and maintained using readily available XML tools instead of the special-purpose ad hoc software originally used for TEI P3.

As noted elsewhere, a number of errors were corrected in the May 1999 edition. A (much) smaller number of errors have also been corrected in this edition, but no new material has been added. We expect the expansion and modification of the Guidelines to become a real possibility in the context of the newly formed TEI Consortium, which has funded the preparation of this present edition.

A major design goal of both this and the previous revision has been to ensure that the DTD fragments generated would not break existing documents: in other words, that any document conforming to the original TEI P3 SGML DTD would also conform to the new XML version of it. Although full backwards compatibility cannot be guaranteed, we believe our implementation is consistent with that goal.

In making this new version, we relied extensively on preliminary work carried out by the outgoing North American editor of the TEI Guidelines, Michael Sperberg-McQueen. In a TEI working paper written in 1999, TEI ED W69, Michael sketched out a precise blueprint for the conversion of the TEI from SGML to XML, which we have implemented, with only slight modification. The current TEI editors wish to express here our admiration for the detailed care put into that paper, without which our task would have been forbiddingly difficult, if not impossible. We would also like to express our thanks to Sebastian Rahtz of Oxford University Computing Services, for his invaluable assistance in preparing this new edition.

We list here in summary form all the changes made in the present edition. Full technical details are provided in documents TEI EDW69 and TEI EDW70, available from the TEI web site.

1. A new keyword `TEI.XML` has been added. By setting its value to `INCLUDE`, rather than the default `IGNORE`, the user can request generation of an XML rather than an SGML DTD;

2. The content models of all elements have been checked, and, where necessary, changed so that they are equally valid as SGML or as XML;
3. The declared value for all attributes has been changed to a form which is equally valid as SGML or as XML;
4. All the examples have been checked for conformance and converted to use XML syntax, where possible. (This process is currently incomplete.)
5. Some errors and duplications in the class membership of elements from the names and dates tagsets have been corrected.

To implement the first of these, we have parameterized the *tag omissibility* indicators ‘- o’ and ‘- -’ used within element declarations in the DTD. When XML is to be generated, the parameter entities concerned are redeclared with the null string as their value.

The second change was achieved by removing SGML-specific features (ampersand connectors, inclusion and exclusion exceptions, various types of attribute content) from the DTD and revising the syntax of the DTD to conform to XML requirements (specifically in the representation of mixed-content models, and by removing redundant parentheses). In making these changes, we took care to ensure that the resulting content model would continue to accept existing valid documents, though in the nature of things it could not be guaranteed to reject the same set of documents. As further discussed in EDW69 and EDW70, some constraints (exclusion exceptions, for example) which could be carried out by a generic SGML parser using TEI P3 will have to be implemented by a special purpose TEI validator using TEI P4.

Much work remains to be done, firstly in testing the new DTD fragments against as wide a range of TEI materials as possible, secondly in revising the discussion of markup theory and practice within the text to reflect current thinking. A few sections of the current text (the Gentle Introduction to SGML and the discussion of Extended Pointer syntax are two examples) will need substantial rewriting. For the most part, however, we think the Guidelines have stood the test of time well and can be recommended to a new generation of text encoders scarcely born at the time they were first formulated.

Lou Burnard and Steve De Rose (Editors)  
Oxford and Providence, May 2001.

### G.4 Introductory Note (May 1999)

No work of the size and complexity of the TEI *Guidelines* could reasonably be expected to be error-free on publication, nor to remain long uncorrected. It has however taken rather longer than might have been anticipated to complete production of the present corrected reprint of the first edition, for which we present our apologies, both to the many individuals and institutions whose enthusiastic adoption and promotion of the TEI encoding scheme have ensured its continued survival in the rapidly changing world of digital scholarship, and also to the many helpfully critical users whose assiduous uncovering and reporting of our errors have made possible the present revision.

At its first meeting in Bergen, in June 1996, the TEI Technical Review Committee (TRC) approved the setting up of a small working committee to oversee the production of a revised edition of the TEI *Guidelines*, to include corrections of as many as possible of the ‘corrigible errors’ notified to the editors since publication of the first edition in May 1994, the bulk of which are summarized in a TEI working paper (TEI EDW67, available from the TEI web site).

During the spring of 1997, this TRC Core Subcommittee reviewed nearly 200 comments and proposals which the editors had collected from public debate and discussion over the preceding two years, and provided invaluable technical guidance in disposition of them. We are glad to take this opportunity of expressing our thanks to this subcommittee, whose members were Elli Mylonas, Dominic Dunlop, and David T. Barnard.

The work of making the corrections and regenerating the text proceeded rather fitfully during 1998 and 1999, largely because of increasing demands on the editors’ time from their other responsibilities. With the establishment of the new TEI Consortium, it is hoped that maintenance of the Guidelines will be placed on a more secure footing. Some specific areas in which we anticipate future revisions being carried out are listed below.

#### Typographic corrections made

- examples of TEI markup throughout the text were all checked against the relevant DTD fragment and an embarrassingly large number of tagging errors corrected;
- various minor typographic and spelling errors were corrected;
- the ‘corrigible errors’ listed in working paper TEI EDW67 were all corrected: some of these required specific changes to the DTD which are listed in the next section.

## Specific changes in the DTD

A major goal of this revision was to avoid changes which might invalidate existing data, even where existing constructs seemed erroneous in retrospect. To that end, wherever changes have been made in content models for existing elements, they have as far as possible been made so that the DTD will now accept a superset of what was previously legal. Only one new element (`<ab>`) has been added.

Where possible, a few content models have been changed in such a way as to facilitate conversion to XML, but XML compatibility is *not* a goal of this revision.

Brief details of all changes made in the DTD follow:

- Several changes were made in class membership, in order to correct unreachability problems. Specifically:
  - elements `<geogName>`, `<persName>`, `<placeName>` were added to the `m.data` class;
  - `<geogName>` and `<placeName>` were removed from the `m.placepart` class;
  - the elements `<addSpan>`, `<delSpan>`, `<gap>`, were added to the `m.Edit` class;
  - a new class `m.editIncl` was defined, with members `<addSpan>`, `<delSpan>`, and `<gap>`; this class was then added to the global inclusion class `m.globlIncl` along with `<anchor>` (erroneously a member of the `m.Seg` class, from which it is now removed), `m.metadata` and `m.refsys`;
- added `<name>` element to `m.addrPart` class;
- added `<dateline>` to `m.divtop` and `m.divbot` classes;
- added `<epilogue>` and `<castList>` to `m.dramafront` class;
- added `<divGen>` to `m.front` class;
- added `<dateline>` to `m.divtop` and `m.divtop` classes;
- added `<u>` element to `a.declaring` class;
- defined new class `m.fmchunk` (front matter chunk), comprising `<argument>`, `<byline>`, `<docAuthor>`, `<docDate>`, `<docEdition>`, `<docImprint>`, `<docTitle>`, `<epigraph>`, `<head>`, and `<titlePart>` for use in simplification of the content model for `<front>` element;
- defined new element `<ab>` (anonymous block), and added it to the `m.chunk` class;
- corrected an error whereby global attributes were not properly defined for elements specifying a non-default value for any of the `a.global` attributes: elements affected include: `<foreign>`, `<hi>`, `<del>`, `<pb>`, `<lb>`, `<cb>`, `<language>`, `<anchor>`, and `<when>`;
- changed content models to permit empty `<list>` and empty `<availability>` elements;
- changed content model for `<series>` element to permit `#PCDATA`;
- changed content model for `<setting>` element to permit `<date>` element as a direct child;
- added a key attribute to the `<distance>` element, for consistency with other elements in its class;
- changed content model for `<orgName>` element to make it more consistent with e.g. `<persName>`;
- changed content model for `<opener>` element to include `<argument>`, `<byline>`, and `<epigraph>`;
- changed content models for `<app>`, `<rdgGrp>`, and `<wit>` elements;
- revised attributes on `<hand>` element.

A number of content models were changed with a view to easing the creation of an XML compatible version of the Guidelines. Specifically:

- removed ampersand connectors from `<cit>`, `<respStmnt>`, `<publicationStmnt>`, and `<graph>`;
- changed the mixed content models for `<sense>`, `<re>`, `<persName>`, `<placeName>`, `<geogName>`, `<dateStruct>`, `<timeStruct>`, and `<dateline>` to make them XML-conformant.

## Outstanding errors

A small number of other known problems remain uncorrected in this version and are briefly listed below. Please watch the TEI mailing list for announcements of their correction.

- elements of class `model.inter` don't always behave as they should (e.g. one cannot insert a `<table>` before anything else in a `<div>`);
  - some mixed-content problems consequent on the definition of `macro.specialPara` need to be addressed systematically; in particular, the treatment of list items or notes which contain several paragraphs continues to surprise many users: no whitespace is allowed between the paragraphs;
  - the `resp` attributes on editorial elements are not consistently defined;
  - the discussions of DTD invocation, and the DTD itself, all use system identifiers instead of formal public identifiers.
- Our next priority however will be the production of a fully XML-compliant version of the TEI DTD, work on which is already well advanced.

C.M. Sperberg-McQueen and Lou Burnard, May 1999

### G.5 Preface (April 1994)

These Guidelines are the result of over five years' effort by members of the research and academic community within the framework of an international cooperative project called the Text Encoding Initiative (TEI), established in 1987 under the joint sponsorship of the Association for Computers and the Humanities, the Association for Computational Linguistics, and the Association for Literary and Linguistic Computing.

The impetus for the project came from the humanities computing community, which sought a common encoding scheme for complex textual structures in order to reduce the diversity of existing encoding practices, simplify processing by machine, and encourage the sharing of electronic texts. It soon became apparent that a sufficiently flexible scheme could provide solutions for text encoding problems generally. The scope of the TEI was therefore broadened to meet the varied encoding requirements of any discipline or application. Thus, the TEI became the only systematized attempt to develop a fully general text encoding model and set of encoding conventions based upon it, suitable for processing and analysis of any type of text, in any language, and intended to serve the increasing range of existing (and potential) applications and use.

What is published here is a major milestone in this effort. It provides a single, coherent framework for all kinds of text encoding which is hardware-, software- and application-independent. Within this framework, it specifies encoding conventions for a number of key text types and features. The ongoing work of the TEI is to extend the scheme presented here to cover additional text types and features, as well as to continue to refine its encoding recommendations on the basis of extensive experience with their actual application and use.

We therefore offer these Guidelines to the user community for use in the same spirit of active collaboration and cooperation with which they have so far been developed. The TEI is committed to actively supporting the wide-spread and large-scale use of the Guidelines which, with the publication of this volume, is now for the first time possible. In addition, we anticipate that users of the TEI Guidelines will in some instances adapt and extend them as necessary to suit particular needs; we invite such users to engage in the further development of the Guidelines by working with us as they do so.

Like any standard which is actually used, these Guidelines do not represent a static finished work, but rather one which will evolve over time with the active involvement of its community of users. We invite and encourage the participation of the user community in this process, in order to ensure that the TEI Guidelines become and remain useful in all sorts of work with machine-readable texts.

This document was made possible in part by financial support from the U.S. National Endowment for the Humanities, an independent federal agency; Directorate General XIII of the Commission of the European Communities; the Andrew W. Mellon Foundation; and the Social Science and Humanities Research Council of Canada. Direct and indirect support has also been received from the University of Illinois at Chicago, the Oxford University Computing Services, the University of Arizona, the University of Oslo and Queen's University (Kingston, Ont.), Bellcore (Bell Communications Research), the Istituto di Linguistica Computazionale (C.N.R.) Pisa, the British Academy, and Ohio State University, as well as the employers and host institutions of the members of the TEI working committees and work groups listed in the acknowledgments.

The production of this document has been greatly facilitated by the willingness of many software vendors to provide us with evaluation versions of their products. Most parts of this text have been processed at some time by almost every currently available SGML-aware software system. In particular, we gratefully acknowledge the assistance of the following vendors:

- Berger-Levrault AIS s.a. (for Balise);

- E2S n.v. (for E2S Advanced SGML Editor);
- Electronic Book Technology (for DynaText);
- SEMA Group and Yard Software (for Mark-It and Write-It);
- Software Exoterica (for CheckMark and Xtran);
- SoftQuad, Inc., (for Author/Editor and RulesBuilder);
- Xerox Corporation (for Ventura Publisher).

Details of the software actually used to produce the current document are given in the colophon at the end of the work.

## G.6 Acknowledgments

Many people have given of their time, energy, expertise, and support in the creation of this document; it is unfortunately not possible to thank them all adequately. Below are listed those who have served as formal members of the TEI's Work Groups and Working Committees during its six-year history; others not so officially enfranchised also contributed much to the quality of the result.

The editors take this opportunity to acknowledge our debt to those who have patiently endured and corrected our misunderstandings of their work; we hope that they will feel the wait has not been in vain. For any errors and inconsistencies remaining, we must accept responsibility; any virtue in what is here presented, we gladly ascribe to the energies of the keen intellects listed below.

C. M. Sperberg-McQueen and Lou Burnard

### TEI Working Committees (1990-1993)

Not all members listed were able to serve throughout the development of the Guidelines.

**Committee on Text Documentation:** Chair: Dominik Wujastyk (Wellcome Institute for the History of Medicine)

Members 1990–1992: J. D. Byrum (Library of Congress); Marianne Gaunt (Rutgers University); Richard Giordano (Manchester University); Barbara Ann Kipfer (Independent Consultant); Hans Jørgen Marker (Danish Data Archive, Odense); Marcia Taylor (University of Essex);

**Committee on Text Representation** Chair: Stig Johansson (University of Oslo)

Members 1990–1992: Roberto Cencioni (Commission of the European Communities); David R. Chesnutt (University of South Carolina); Robin C. Cover (Dallas Theological Seminary); Steven J. DeRose (Electronic Book Technology Inc); David G. Durand (Boston University); Susan M. Hockey (Oxford University Computing Service); Claus Huitfeldt (University of Bergen); Francisco Marcos-Marin (University Madrid); Elli Mylonas (Harvard University); Wilhelm Ott (University of Tübingen); Allen H. Renear (Brown University); Manfred Thaller (Max-Planck-Institut für Geschichte, Göttingen)

**Committee on Text Analysis and Interpretation** Chair: D. Terence Langendoen (University of Arizona)

Members 1990–1992: Robert Amsler (Bell Communications Research); Stephen Anderson (Johns Hopkins University); Branimir Boguraev (IBM T. J. Watson Research Center); Nicoletta Calzolari (University of Pisa); Robert Ingria (Bolt Beranek Newman Inc); Winfried Lenders (University of Bonn); Mitch Marcus (University of Pennsylvania); Nelleke Oostdijk (University of Nijmegen); William Poser (Stanford University); Beatrice Santorini (University of Pennsylvania); Gary Simons (Summer Institute of Linguistics); Antonio Zampolli, University of Pisa.

**Committee on Metalanguage and Syntax** Chair: David T. Barnard (Queen's University)

Members 1990–1994: David G. Durand (Boston University); Jean-Pierre Gaspart (Associated Consultants and Software Engineers sa/nv); Nancy M. Ide (Vassar College); Lynne A. Price (Software Exoterica / Xerox PARC); Frank Tompa (University of Waterloo); Giovanni Battista Varile (Commission of the European Communities).

In addition, the two TEI editors served *ex officio* on each committee.

Following publication of the first draft of the TEI Guidelines (P1) in November 1990, a number of specialist work groups were charged with responsibility for drafting revisions and extensions, which, together with material already presented in P1, constitute the basis of the present work.

In addition, many members of the work groups listed below met on three occasions to review the emerging proposals in detail at technical review meetings convened by the TEI Steering Committee. These meetings, held in Myrdal, Norway (November 1991), Chicago (May 1992) and Oxford (May 1993), were largely responsible for the technical content and organization of the present work. Attendants at these meetings are starred in the list below.

**TR1 Character sets** Chair: Harry Gaylord\* (University of Groningen); Syun Tutiya\* (Chiba University).

**TR2 Text criticism** Chair: Peter Robinson\* (Oxford University); David Chesnutt\* (University of South Carolina); Robin Cover\* (Dallas Theological Seminary); Robert Kraft (University of Pennsylvania); Peter Shillingsburg (Mississippi State University).

**TR3 Hypertext and hypermedia** Chair: Steven J. DeRose\* (Electronic Book Technologies Inc); David Durand (Boston University); Edward A. Fox (Virginia State University); Eve Wilson (University of Kent).

**TR4 Formulæ, Tables, figures, and graphics** Chair: Paul Ellison\* (University of Exeter); Anders Berglund (Independent Consultant); Dale Waladt (Thompson Professional Publishing).

**TR6 Language corpora** Chair: Douglas Biber\* (University of Northern Arizona); Jeremy Clear (Birmingham University); Gunnel Engwall (University of Stockholm).

**TR9 Manuscripts and codicology** Chair: Claus Huitfeldt\* (University of Bergen); Dino Buzzetti (University of Bologna); Jacqueline Hamesse (University of Louvain); Mary Keeler (Georgetown University); Christian Kloesel (Indiana University); Allen Renear\* (Brown University); Donald Spaeth (Glasgow University).

**TR10 Verse** Chair: David Robey\* (University of Manchester); Elaine Brennan\* (Brown University); David Chisholm (University of Arizona); Willard McCarty (University of Toronto).

**TR11 Drama and performance texts** Chair: Elli Mylonas\* (Harvard University); John Lavagnino\* (Brandeis University); Rosanne Potter (University of Iowa).

**TR12 Literary prose** Chair Thomas N. Corns\* (University of Wales); Christian Delcourt (University of Liège).

**AI1 Linguistic description** Chair: D. Terence Langendoen\* (University of Arizona); Stephen R. Anderson (Johns Hopkins University); Nicoletta Calzolari (University of Pisa); Geoffrey Sampson\* (University of Sussex); Gary Simons\* (Summer Institute of Linguistics).

**AI2 Spoken text** Chair: Stig Johansson\* (University of Oslo); Jane Edwards (University of California at Berkeley); Andrew Rosta (University College London).

**AI3 Literary studies** Chair: Paul Fortier\* (University of Manitoba); Christian Delcourt (University of Liège); Ian Lancashire (University of Toronto); Rosanne Potter (University of Iowa); David Robey\* (University of Manchester).

**AI4 Historical studies** Chair: Daniel Greenstein\* (University of Glasgow); Peter Denley (Queen Mary Westfield College, London); Ingo Kropac (University of Graz); Hans Jørgen Marker (Danish Data Archive, Odense); Jan Oldervoll (University of Tromsø); Kevin Schurer (University of Cambridge); Donald Spaeth (Glasgow University); Manfred Thaller (Max-Planck-Institut für Geschichte, Göttingen).<sup>131</sup>

**AI5 Print dictionaries** Chairs: Robert Amsler\* (Bell Communications Research) and Nicoletta Calzolari (University of Pisa); Susan Armstrong-Warwick (University of Geneva); John Fought (University of Pennsylvania); Louise Guthrie (University of New Mexico); Nancy M. Ide\* (Vassar College); Frank Tompa (University of Waterloo); Carol Van Ess-Dykema (US Department of Defense); Jean Veronis (University of Aix-en-Provence).

**AI6 Machine lexica** Chair: Robert Ingria\* (Bolt Beranek Newman Inc); Susan Armstrong-Warwick (University of Geneva); Nicoletta Calzolari (University of Pisa).

**AI7 Terminological data** Chair: Alan Melby\* (Brigham Young University) Gerhard Budin (University of Vienna); Gregory Shreve (Kent State University); Richard Strehlow (Oak Ridge National Laboratory); Sue Ellen Wright (Kent State University).

### Advisory Board

Members of the TEI Advisory Board during the lifetime of the project are listed below, grouped under the name of the organization represented.

---

<sup>131</sup>This Workgroup was jointly sponsored by the Association for History and Computing.

**American Anthropological Association:** Chad McDaniel (University of Maryland).

**American Historical Association:** Elizabeth A. R. Brown (Brooklyn College, CUNY).

**American Philological Association:** Jocelyn Penny Small (Rutgers University).

**American Philosophical Association:** Allen Renear (Brown University).

**American Society for Information Science:** Clifford A. Lynch (University of California).

**Association for Computing Machinery, Special Interest Group for Information Retrieval:** 1989–93: Scott Deerwester (University of Chicago); 1993– : Martha Evens (Illinois Institute of Technology).

**Association for Documentary Editing:** David Chesnutt (University of South Carolina).

**Association for History and Computing:** 1989–91: Manfred Thaller, Max-Planck-Institut für Geschichte, Göttingen; 1991– : Daniel Greenstein (Glasgow University).

**Association Internationale Bible et Informatique** 1989–93: Wilhelm Ott (University of Tübingen); 1993– : Winfried Bader (University of Tübingen).

**Canadian Linguistic Association:** Anne-Maria di Sciullo (Université du Québec à Montréal)

**Dictionary Society of North America:** Barbara Ann Kipfer (Independent Consultant).

**AAP Electronic Publishing Special Interest Group:** 1989–92: Betsy Kiser (OCLC); 1992– : Deborah Bendig and Andrea Keyhani (OCLC).

**International Federation of Library Associations and Institutions:** J. D. Byrum Jr. (The Library of Congress).

**Linguistic Society of America:** Stephen Anderson (The Johns Hopkins University)

**Modern Language Association:** Randall Jones (Brigham Young University) and Ian Lancashire (University of Toronto).

#### **Steering Committee Membership**

Members of the Steering Committee of the TEI during the preparation of this work were:

##### **Association for Computational Linguistics:**

- 1987–1993: Robert A. Amsler (Bell Communications Research);
- 1987–1993: Donald E. Walker (Bell Communications Research);
- 1993–1994: Susan Armstrong-Warwick (University of Geneva);
- 1994–1999: Judith Klavans (Columbia University).

##### **Association for Computers and the Humanities:**

- 1987–1999: Nancy M. Ide (Vassar College);
- 1987–1994: C. M. Sperberg-McQueen (University of Illinois at Chicago);
- 1994–1999: David Barnard (Queen's University).

##### **Association for Literary and Linguistic Computing:**

- 1987–1999: Susan M. Hockey (Center for Electronic Texts in the Humanities);
- 1987–1999: Antonio Zampolli (University of Pisa).

## H Colophon

The text of this manual was prepared electronically on a variety of systems. Most sections were originally drafted by members of the work groups and working committees of the TEI; all have been revised by the editors to achieve greater uniformity of style and greater consistency in the tag set.

The web release of the Guidelines was created using a library of XSLT stylesheets to convert to XHTML; the PDF version for printing was produced by conversion to LaTeX markup, processed using XeLaTeX. The XSLT libraries were written by Sebastian Rahtz.

Almost every available SGML and XML editor or processing program has been used at one time or another by the TEI; but without the open source implementations of XML parsers, editors and XSLT engines by James Clark, Richard Stallman, Michael Kay, and Daniel Veillard, the TEI could not survive, and we thank these individuals. We would also like to thank the staff at Syncrosoft, creators of the oXygen editor, for their support for the TEI during the creation on P5.

Many volunteers contributed to the preparation of this release of the Guidelines; we particularly note the work of Sabine Krott, Eva Radermacher and Arianna Ciula for their work in structuring the bibliographies.

The production and release process for TEI P5 was managed by Sebastian Rahtz for the TEI Technical Council.

## Index

Entries in *italic font* refer to examples, with those in **bold** italics referring to examples where the indexed element is the root.
